# Brief Tree Report

We are pleased to provide this brief tree report for 20 Haringey Park, N8 9HY based upon works viewed on our recent visit.

| **Item:** | **Description:** |
|---|---|
| Front Garden: | |
| Elder: | Approximately 7.00m. Condition poor/fair. This tree is somewhat one-sided and is carrying a significant amount of dead wood and overhangs the garden. It does have merit for its screening properties. We recommend; Reduce overhang back from no. 20 by 30-40%, approximately 1.50-2.00m, and remove dead wood. This will reduce any potential hazards and help promote a more balance crown structure. |
| Ash and Sycamore: | Multi-stemmed. Approximately 16.00m. Condition good. Evidence of included union and stems are growing very close at ground level. Some evidence of lifting of public footway. This mature group also overhangs no. 20 and casts heavy shade in summer months. We recommend; Reduce lateral and sub lateral branches overhanging 20 Haringey Park by 30%, 2.00-2.50m. Thin whole crown density by 25-30%. Remove dead wood. Raise crown by 1.50m. This action will increase light levels, will raise tree canopy over the road and maintain tree at reasonable dimensions for its location. |
| Lime: | Approximately 20.00m. Condition fair/good. Carrying a significant amount of dead wood. Historically managed by means of pollarding. Some evidence of decay pockets at original pollard points. This large mature tree is certainly in need of maintenance. A pruning regime of reduction every 3-5 years would be prudent. At this juncture we recommend; reduce crown back to previous growth points whilst preserving a suitable amount of furnishing growth in order to ensure crown continuity. Remove epicormic growth from main stem. Prune basal growth as is practicable. Remove dead wood and broken branches throughout. This action will help maintain the trees dimensions at a suitable size for its location and help prevent potential hazards from this tree which is located over public footway. |
