

This covering note has been prepared as part of the planning application for the proposed development at 30-36 Clarendon Road, London, N8 0DJ.

As part of a larger previous development scheme (called 9-30 Clarendon Road), a Desk Study Basement Impact Assessment was carried out by Geotechnical & Environmental Associates Ltd (GEA) in their report reference J20293 (Appended).

The report included a desk study, a BIA screening stage, a Hydrological and Hydrogeological Assessment and a Land/Slope Stability Assessment, and concluded that 'it is not considered that the proposed basement will have any detrimental impact on either the hydrogeological setting or the stability of the surrounding natural and built environment'.

The new scheme, forming this application, includes a basement which is significantly smaller in plan area and is no deeper than the previous scheme, as illustrated below.

It is therefore considered that the new scheme has no greater impact than the previous scheme, and the conclusions of the report are valid. The report is to be updated in due course for the current scheme.

### APPENDIX

## EXECUTIVE SUMMARY

*This executive summary contains an overview of the key findings and conclusions. No reliance should be placed on any part of the executive summary until the whole of the report has been read. Other sections of the report may contain information that puts into context the findings that are summarised in the executive summary.*

## BRIEF

This report describes the findings of a desk study and Basement Impact Assessment (BIA) carried out by Geotechnical and Environmental Associates Limited (GEA) on the instructions of Graphic Structures, on behalf of Paul Simon Magic Group, with respect to the redevelopment of the site through the demolition of the existing buildings and subsequent construction of a new mixed-used scheme including residential properties and a community centre. A single level basement will be constructed beneath part of the building to provide car parking and plant rooms. The purpose of this report has been to determine the history of the site, to establish the geological, hydrogeological and hydrological setting and to carry out a Basement Impact Assessment (BIA) of any possible effects the proposed development may have on the local hydrogeology and hydrology and the stability of the natural and built environment. The BIA has been carried out in accordance with London Borough of Haringey's Draft Basement Development Guidance Note, dated 2012, although as this document has since been withdrawn, reference has also been made to the London Borough of Camden's BIA guidance.

## SUMMARY OF DESK STUDY FINDINGS

The earliest map studied, dated 1850, shows the Great Northern Railway to have been under construction from approximately 75 m to the west of the site. The New River is also likely to have been under construction approximately 160 m to the west at this time. The next map studied, dated 1863, shows the northern portion of the site to have been occupied by Clarendon Cottages, whilst the southern portion was occupied by buildings assumed to also be houses. A gas works was present approximately 150 m to the north-northwest of the site. By 1896, the site had been fully developed with houses fronting onto Clarendon Road to the west but, by 1914, the houses in the south of the site had been demolished. Four small buildings were constructed over the vacant land by 1955, although were later redeveloped with what appears to be the existing configuration of raised planters by 1971. By 1973, Clarendon Cottages had been demolished. The site was redeveloped with the existing factory and building in the centre of the site by 1979, whilst the southern portion was a car park. The existing West Indian Cultural Centre was established on site by 1989 and the site has since remained essentially unchanged.

On the basis of the findings of the research carried out, there is considered to be a LOW risk of there being any contamination linkage at this site.

## SUMMARY OF BIA SCREENING STAGE

The BIA has identified the following questions carried forward to the scoping stage, which have each been assessed on the basis of the acquired desk study information.

- The site is underlain by the London Clay Formation from the surface.
- The site is within 5 m of a highway of pedestrian or pedestrian right of way.
- The development will result in differential founding depths with respect to adjacent foundations.

## BIA CONCLUSIONS

From the desk study research and the information acquired, a continuous groundwater table will not exist below the site and so the proposed basement will not have an impact on the hydrogeological setting. The development will not increase the proportion of hard-surfaced areas across the site and so there will not be an increase in surface run-off. There is nothing unusual about the proposed single level basement scheme outside of standard engineering practice and design and therefore ground movements would be expected to remain within normal acceptable limits, which from previous experience, would not lead to unacceptable damage to neighbouring properties and the adjacent highway. On the basis of all of the above, it is not considered that the proposed basement will have any detrimental impact on either the hydrogeological and hydrological setting or the stability of the surrounding natural and built environment.

## RECOMMENDATIONS

A Preliminary Unexploded Ordnance (UXO) Risk Assessment will be required in order to provide an indication of the risk of encountering UXO beneath the site before carrying out any intrusive ground investigations. An asbestos survey will be required prior to any demolition works. Loads for the new development are anticipated to be moderate to high and as such, piled foundations are likely to be required. A Ground Movement Assessment is likely to be a planning requirement.

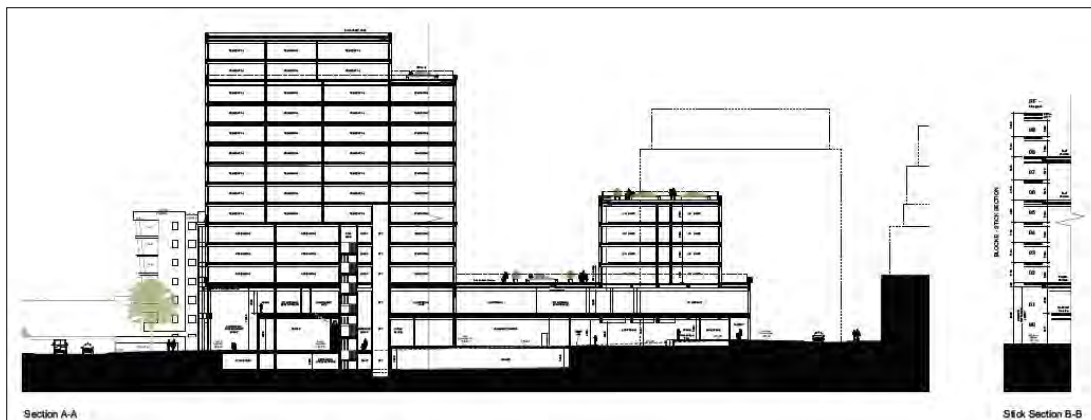

## 1.0 INTRODUCTION

Geotechnical and Environmental Associates Limited (GEA) has been commissioned by Graphic Structures, on behalf of Paul Simon Magic Group, to carry out a desk study and Basement Impact Assessment (BIA) at 9–30 Clarendon Road, London N8 0DJ in support of a planning application. The site is located within the London Borough of Haringey.

London Borough of Haringey (“the Council”) issued a draft Basement Development Guidance Note in 2012, which set out a framework for assessing the impacts of proposed basements in accordance with the Development Management Policy (DMP) 8 – ‘Basements and Lightwells’; this guidance has subsequently been withdrawn. However, the council still requires the planning application for this project to be accompanied by a basement impact assessment (BIA) in order to assess any potential impact on the structural stability of the application building and neighbouring buildings or infrastructure, in view of the geological setting. The assessment also needs to determine, if any, the likely increase in risk of localised flooding. In the absence of current guidance, the Camden BIA policy guidance for basements has largely been adopted as it is widely known and is considered to provide a robust approach to the issues of potential concern.

### 1.1 Proposed Development

It is understood that it is proposed to demolish the existing buildings and to subsequently construct a new mixed-used scheme including residential properties and a community centre. The new building will vary from two storeys to 14 storeys high. A single level basement is to be constructed beneath part of the building to provide car parking and to house plant rooms, and the building will be surrounded by areas of communal soft landscaping and pathways.

*Proposed section of the new building including single level basement (extract from section drawing ref 3510-AL(20)400, dated May 2020, created by Stock Wool architects and provided by Graphic Structures).*

This report is specific to the proposed development and the advice herein should be reviewed if the development proposals are amended.

### 1.2 Purpose of Work

The principal technical objectives of the work carried out were as follows:

- ☐ to check the history of the site and surrounding area, in particular with respect to contaminative uses;
- ☐ to research the geology and hydrogeology of the site;

- ❑ to check records of data on groundwater, surface water and other publicly available environmental data;
- ❑ to use the information obtained in the above searches to carry out a qualitative risk assessment with respect to subsurface contamination; and
- ❑ to assess the possible impact of the proposed development on the local hydrogeology, hydrology and stability of surrounding structures in support of a basement planning application.

### 1.3 Scope of Work

In order to meet the above objectives, a desk study has been carried out comprising, in summary, the following activities:

- ❑ a review of historical Ordnance Survey (OS) maps and environmental searches sourced from the Envirocheck database;
- ❑ a review of readily available geology maps; and
- ❑ provision of a report presenting and interpreting the above data, together with our advice and recommendations with respect to the proposed development.

This report includes a contaminated land assessment which has been undertaken by a suitably qualified and competent professional in accordance with the methodology presented by the Environment Agency in their Land contamination risk assessment (LCRM)<sup>1</sup> published 8 October 2020. This involves identifying, making decisions on, and taking appropriate action to deal with, land contamination in a way that is consistent with government policies and legislation within the United Kingdom. Risk management is divided into three stages; Risk Assessment, Options Appraisal and Remediation, and each stage comprises three tiers. The Risk Assessment stage includes preliminary risk assessment (PRA), generic quantitative risk assessment (GQRA) and detailed quantitative risk assessment (DQRA) and this report includes the PRA.

#### 1.3.1 Basement Impact Assessment

The work carried out includes a Hydrological and Hydrogeological Assessment and Land Stability Assessment (also referred to as Slope Stability Assessment), all of which form part of the BIA procedure specified in the London Borough of Camden (LBC) Planning Guidance CPG4<sup>2</sup> and their Guidance for Subterranean Development<sup>3</sup> prepared by Arup (the “Arup report”). The aim of the work is to provide information on surface water, groundwater and land stability and in particular to assess whether the development will affect neighbouring properties or groundwater movements and whether any identified impacts can be appropriately mitigated by the design of the development.

#### 1.3.2 Qualifications

The land stability element of the Basement Impact Assessment (BIA) has been carried out by Martin Cooper, a BEng in Civil Engineering, a chartered engineer (CEng), member of the Institution of Civil Engineers (MICE), and Fellow of the Geological Society of London (FGS) who has over 25 years’ specialist experience in ground engineering.

<sup>1</sup> <https://www.gov.uk/government/publications/land-contamination-risk-management-lcrm>

<sup>2</sup> London Borough of Camden Planning Guidance CPG4 *Basements and lightwells*

<sup>3</sup> Ove Arup & Partners (2010) *Camden geological, hydrogeological and hydrological study. Guidance for Subterranean Development*. For London Borough of Camden November 2010

The assessments have been made in conjunction with Steve Branch, a BSc in Engineering Geology and Geotechnics, MSc in Geotechnical Engineering, a chartered geologist (CGeol) and Fellow of the Geological Society (FGS) with over 30 years' experience in geotechnical engineering and engineering geology.

The assessors meet the qualification requirements of the Council guidance.

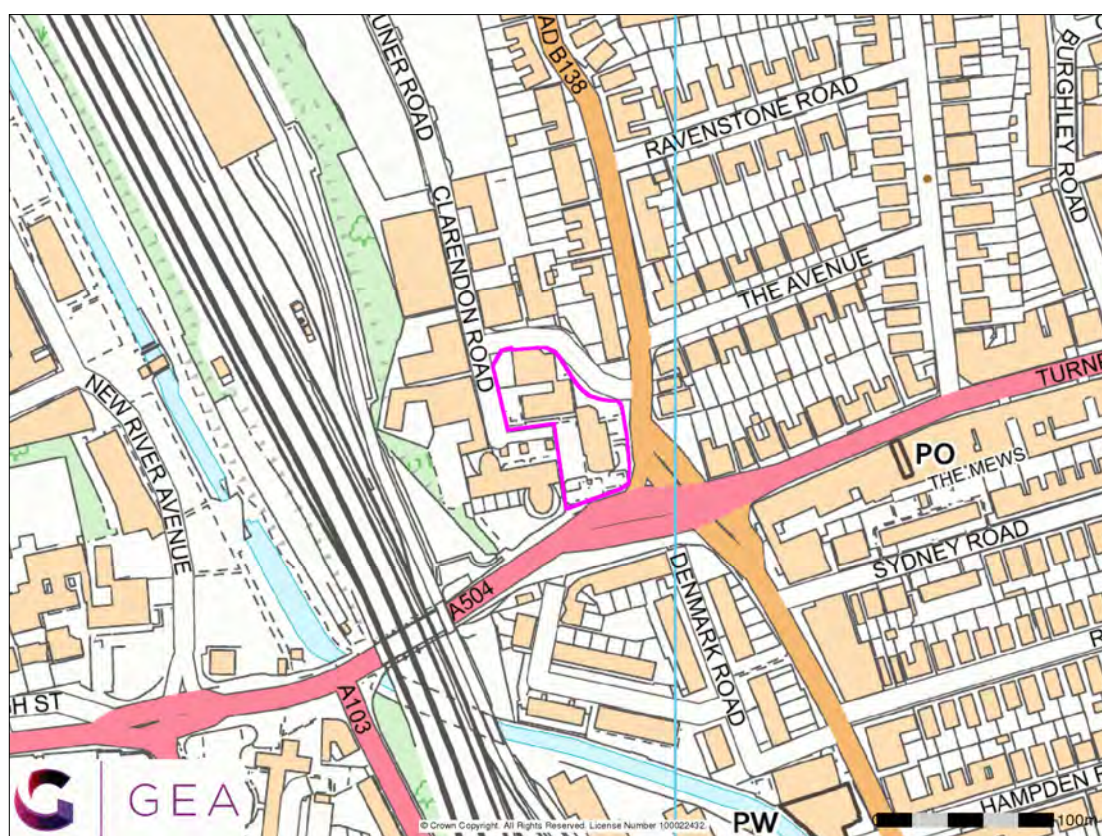

## 1.4 Limitations

The conclusions and recommendations made in this report are limited to those that can be made on the basis of the research carried out. The results of the research should be viewed in the context of the work that has been carried out and no liability can be accepted for matters outside the stated scope of the research. Any comments made on the basis of information obtained from third parties are given in good faith on the assumption that the information is accurate. No independent validation of third party information has been made by GEA.

## 2.0 THE SITE

### 2.1 Site Description

The site is located in the London Borough of Haringey, approximately 350 m northeast of Hornsey Railway Station and approximately 540 m west of Turnpike Lane London Underground Station. The northern portion of the site is bounded by Clarendon Road to the north, east and west whilst the southern portion is bound by Clarendon Road to the north, a six-storey block of flats to the west, the B1838 / Horney Park Road to the east and by a filter lane off Turnpike Lane / the A504 to the south. The site may be additionally located by National Grid Reference 530945, 189521 and is shown on the map extract below.

It was not possible to carry out a walkover survey of the site at the time of writing and so the following information is based on information available online and provided by the consulting engineers, Graphic Structures. The site is irregular in shape and measures approximately 90 m north to south by 65 m east to west in maximum dimensions, although can generally be divided into two offset north and south sections each measuring roughly 42 m square. The northern portion is occupied by a collection of two-storey buildings including a warehouse and office, a church and the Haringey Recovery College community centre including a café, whilst the southern portion is occupied by a two-storey West Indian Cultural Centre. A single-storey shed is present in the centre of the site and the roof is suspected of containing asbestos.

The buildings are surrounded by access paths and car parking spaces with small patches of grass and shrubs generally scattered throughout the site, although mainly present in the south, and deciduous trees between 10 m and 17 m high line the surrounding roads to the east and south of the site. The site slopes down gently from an elevation of around 25 m OD in the north to around 23.5 m OD in the south.

## 2.2 Site History

The site history has been researched by reference to internet sources and historical Ordnance Survey (OS) maps obtained from the Envirocheck database.

The earliest map studied, dated 1950, shows the Great Northern Railway to have been under construction from approximately 75 m to the west of the site. The New River is likely to have also been under construction at this time and is shown on the other side of the railway from approximately 160 m to the west of the site, then curving around under the tracks at the junction 130 m to the southwest of the site, before continuing to the south. Tottenham Lane was present in the position of the existing Turnpike Lane immediately to the south of the site.

The next map studied, dated 1863, shows the northern portion of the site to have been occupied by Clarendon Cottages, whilst the southern portion was occupied by a number of square and rectangular shaped buildings of unknown use, although they were probably housing or outbuildings of some kind. Clarendon Road was in existence to the west and wrapped around the western border of the site, connecting to Tottenham Lane to the south. The Great Northern Railway was established on an embankment to the west of the site, with a pump house and engine house on the far side of the tracks approximately 180 m to the west of the site. A gas works, including a circular gas holder, was present along the eastern side of the tracks from approximately 150 m to the north-northwest of the site.

By 1896, the site had been fully developed with houses fronting onto Clarendon Road to the west, the renamed Turnpike Lane to the south and the newly constructed Hornsey Park Road to the east. A smithy was present approximately 10 m to the west of the southern portion of the site on the other side of Clarendon Road and a brewery was present along the same road and located approximately 20 m west of the northern portion of the site. The surrounding area had been extensively developed, mostly with housing, and was named Hornsey Park. The gas works to the north-northwest had been relocated to approximately 170 m north of the site and had expanded to include three larger assumed gas holders.

By 1914, the houses in the very south of the site fronting onto Turnpike Lane had been demolished and the area instead appeared to form vacant land. The site remained essentially unchanged for the next 40 years. The railway tracks had expanded and more lines were added over an area that was previously labelled as a siding, located around 100 m northwest of the site.

The smithy is not shown on the 1935 historical map, but reappears on the 1955 map next to its previous location and still around 10 m west of the site. The smaller of the three gas holders to the north is labelled as a tank on the 1935 map, whilst the brewery to the west is no longer labelled. The larger scale mapping shows another large gas holder to have been constructed approximately 330 m north of the site by 1938.

Four small buildings had been constructed in the previously vacant plot of land in the south of the site by 1955, although were later redeveloped by 1971 with what appears to be the existing configuration of raised planters. By 1973, the original Clarendon Cottages in the centre of the site had been demolished and the area was vacant. The former brewery to the west was redeveloped as a works and the small houses surrounding it had also been demolished. The smaller gas tank to the north of the site was no longer present but an electricity substation, although not labelled until 1981, had been constructed approximately 235 m to the north of the site at the gas works.

By 1979, the site was entirely redeveloped and the houses in the north were replaced with the existing factory, the existing building in the centre of the site and the southern portion of the site was a car park. The building in the centre was a day centre. An electricity substation had been constructed on the other side of the block of flats to the southwest, approximately 45 m from the site. One of the two remaining gas holders closest to the site appears to have been demolished, with just a circular depression with a path running over it shown on the 1979 map.

By 1981, two factories and a depot had been constructed and replaced houses from around 40 m to the north of the site. The existing West Indian Cultural Centre was established on site by 1989 and the site has since remained essentially unchanged. Some of the infrastructure within the gas works to the north of the site had been demolished by 1989, although holders and depots remained present further to the north from around 270 m to the north of the site, and the gas works remains present today.

## 2.3 Other Information

A search of public registers and databases has been made via the Envirocheck database and relevant extracts from the search are appended. Full results of the search can be provided if required.

The Envirocheck report has indicated that there are no BGS recorded landfill, historical landfill, local authority recorded landfill sites, integrated pollution control or registered waste sites within 1 km of the site. A licensed waste management facility is located 399 m to the west of the site but the licence was surrendered in 2014 and in any case, at such a distance is unlikely to have affected the site. The nearest registered waste transfer site is more than 600 m from the site and is also unlikely to have affected the site at that distance. The nearest area of infilled land (over water) is located 329 m to the southeast and is likely to relate to the infilling of a former pond or stream but again, at such a distance is not considered to represent a risk to the site.

Two active entries for the Control of Major Accident Hazard (COMAH) sites are positioned 319 m and 365 m to the north of the site at the gas works. The gas works is also subject to an inactive Notification of Installations Handling Hazardous Substances (NIHHS) and two permissions are recorded as granted for Planning Hazardous Substance Consents. No other COMAH, NIHHS or hazardous substance consents are located within 1 km of the site.

The nearest discharge consent is located 173 m to the southwest of the site at a Thames Water pumping station and several other consents are recorded for the same site at distances of between 177 m to the southwest and 286 m to the west. No other entries are located within 350 m of the site.

There are four groundwater abstraction points located 170 m, 177 m, 197 m and 207 m to the southwest and west of the site, which are also positioned at the Thames Water pumping station. There are no other abstraction points within 350 m of the site.

The nearest fuel station is located 239 m to the southeast at Wightman Service Centre, but the status is recorded as obsolete. The nearest open petrol station is more than 900 m away from the site. A Local Authority Pollution Prevention and Control point is authorised for the petrol filling station 239 m to the southeast of the site, but is unlikely to affect the site at such a distance. A second point is recorded for 292 m to the north of the site at the gas works but the authorisation was revoked, although at an unknown date. No other entries are located within 400 m of the site.

There are no pollution incidents to controlled waters within 250 m of the site.

The Envirocheck report does not indicate the site to be at risk of extreme flooding or flooding from rivers or the sea without defences, and the site is not within an area benefitting from flood defences.

Reference to records compiled by the Health Protection Agency (formerly the National Radiological Protection Board) indicates that the site falls within an area where less than 1 % of homes are affected by radon emissions and therefore radon protective measures will not be necessary.

An active Contemporary Trade Directory Entry is recorded for the factory in the north of the site at 30 Clarendon Road and it is categorised as a tungsten tool manufacturers and distributors. The factory is also listed as a point of interest relating to manufacturing and production. Reference to the website for the business instead suggests that it is instead a button, belt and trimmings wholesalers and that their products are manufactured abroad. It is therefore more likely that the site is used for storage, rather than for manufacturing and production. No other contemporary trade directory entries are recorded for the site.

Several contemporary trade directory entries are however recorded for the surrounding area and the features within 100 m are summarised below.

| Distance from site | Address                          | Entry                                 | Status   |
|--------------------|----------------------------------|---------------------------------------|----------|
| 13 m NW            | 25 Aztec Studios, Clarendon Road | Cabinet makers                        | Inactive |
| 14 m NW            | Aztec Studios, Clarendon Road    | Metal workers                         | Inactive |
| 24 m NW            | 50 Clarendon Road                | Engineers - general                   | Inactive |
| 24 m NW            | 50 Clarendon Road                | Stained glass designers and producers | Inactive |
| 27 m W             | 19 Clarendon Road                | Printers                              | Inactive |
| 32 m NW            | 13 Clarendon Road                | Clothing and fabric manufacturer      | Inactive |

| Distance from site | Address               | Entry                                       | Status   |
|--------------------|-----------------------|---------------------------------------------|----------|
| 34 m NW            | 25 Clarendon Road     | Clothing and fabric manufacturer            | Inactive |
| 34 m NW            | 27 Clarendon Road     | Car breakdown and recovery services         | Inactive |
| 34 m NW            | 25-27 Clarendon Road  | Clothing and fabric manufacturer            | Inactive |
| 55 m N             | 41a Hornsey Park Road | Garage services (assumed vehicle servicing) | Inactive |
| 97 m SE            | 308 Wightman Road     | Freight forwarders                          | Active   |

It is noteworthy that the majority of the entries are inactive and do not therefore represent an ongoing risk to the site. Historical contamination may be present and these risks are further assessed in Section 2.6.

Additionally, two points of interest relating to commercial services, specifically vehicle repair, testing and servicing, are located 55 m to the north of the site at 41a Hornsey Park.

The site is within a Source Protection Zone (I and II) but is not within any other sensitive land use, and there are no other sensitive land uses within 500 m of the site.

### 2.3.1 Statutory Service Search

A search of statutory providers has been carried out as part of this desk study. The search has indicated Cadent Gas, Thames Water, UK Power Network and BT have assets beneath or on the site. The full results of the search are provided in the appendix. They may need to be contacted prior to intrusive works and construction to demonstrate that their assets will not be affected.

The utility maps provided by the relevant companies have a limited validity, such that if intrusive works will be undertaken beyond the allocated time of the maps, the service searches may need to be repeated. The Cadent Gas map is valid for 28 days from creation and the UK Power Network maps are valid for three months from creation, for example.

## 2.4 Geology

The British Geological Survey (BGS) map of the area indicates that the site is underlain by the London Clay Formation. A nominal thickness of made ground is anticipated at the surface given the developed history of the site. The London Clay typically comprises homogenous, slightly calcareous silty clay to very silty clay, with some beds of clayey silt grading to silty fine-grained sand.

The BGS map of the area reproduced by Envirocheck, as appended, indicates areas of so-called landscaped ground to be present around 75 m to the west and 150 m to the north. The area to the west is likely to be associated with the constriction of the railway embankment. It is not known what the ground to the north represents but it is in the location of the gas works and so is probably associated with works in that area.

The BGS hold archive records of a borehole (ref TQ38NW3) advanced in 1906 immediately to the southwest of the site, at the location of the existing block of flats on the other side of Clarendon Road, although the record is named Hornsey Brewery and so may have instead been advanced closer to the location of the brewery shown on historical maps to have been present approximately 20 m west of the site. The record starts with a 1.5 m deep well with no

recorded ground conditions, followed by yellow clay, yellow clay with stones then blue clay and yellow clay of the London Clay Formation that extended to a depth of approximately 36.30 m (-10.40 m OD). The ground conditions encountered then comprised grey mottled clay, sandy clay, 'dead sand' then clay and shells of the Lambeth Group, formerly referred to as the Woolwich and Reading Beds, to a depth of 44.50 m (-18.60 m OD) over 'dead sand' and black pebbles with sand of the Thanet Sand, which extended to a depth of around 55.20 m (-29.30 m OD), whereupon chalk with flints was encountered and proved to the base of the borehole at 85.30 m (-59.40 m OD).

## 2.5 Hydrology and Hydrogeology

The London Clay Formation is classified as an Unproductive Stratum, referring to rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.

The nearest surface water feature is the New River, located 127 m to the south of the site.

The Lost Rivers of London<sup>4</sup> does not cover the site. An extract appended to the Haringey draft guidance shows the path of the Moselle Brook, one of London's "lost rivers" flowed roughly 600 m to the north of the site, and therefore no former rivers have been identified in close proximity to the site.

The London Clay is not capable of supporting a groundwater table, although isolated pockets of perched groundwater do occur within fissures and silt and sand partings. Published data for the permeability of the London Clay indicates the horizontal permeability to range between  $1 \times 10^{-11}$  m/s and  $1 \times 10^{-9}$  m/s, with an even lower vertical permeability.

The aforementioned BGS archive record indicates a water level of 3.35 m but it should be noted that the borehole extends through granular deposits of the Lambeth Group, the Thanet Sand and the underlying chalk, all of which are water bearing and confined beneath the London Clay, and so the groundwater recorded is possibly artesian.

The site is almost entirely covered by the existing buildings and surrounding hardstanding and therefore infiltration of rainwater into the ground beneath the site is limited to areas of soft landscaping. The majority of surface runoff is however likely to drain into combined sewers in the road.

## 2.6 Preliminary Risk Assessment

Part IIA of the Environmental Protection Act 1990, which was inserted into that Act by Section 57 of the Environment Act 1995, provides the main regulatory regime for the identification and remediation of contaminated land. The determination of contaminated sites is based on a "suitable for use" approach which involves managing the risks posed by contaminated land by making risk-based decisions. This risk assessment is carried out on the basis of a source-pathway-receptor approach.

### 2.6.1 Source

The desk study findings do not indicate the site to have a significantly contaminative history, having been developed with the existing buildings between around 1979 and 1989, prior to which it was occupied by housing. The factory present in the north of the site is expected to be used mainly for storage, as opposed to manufacturing and production, and is not therefore

<sup>4</sup> Barton, N, & Meyers, S (2016) *The Lost Rivers of London (revised and extended edition with colour maps)*. Historical Publications Ltd.

considered to represent a contaminative use. The other uses currently on site are not considered contaminative. The buildings on site were constructed during a time when asbestos was used in building materials and the small outbuilding in the east of the site is suspected of containing and asbestos coated roof. No other and no significant on-site sources of contamination have been identified and additionally, no on-site sources of soil gas have been identified.

Off-site sources of contamination have been identified in the area surrounding the site and these are summarised below with reference to the relevant Department of the Environment Industry Profiles.

| Distance from site | Source                                                  | Dates present                         | Associated contaminants                                                                                                                                                                                                                                                                                                                                     |

It is likely that the metal works, engineers, stained glass producers, printers, clothing manufactures and garages occupied the factories present to the north of the site at some time, although further details could not be found. As all entries are inactive, they do not represent an ongoing risk to the site. The contemporary trade directory entry for the freight forwarders located 97 m to the southeast of the site is not considered to represent a contaminative source.

The substation on the other side of the block of flats approximately 45 m to the west of the site is not likely to have affected the site at that distance, as associated PCB contamination is generally limited to the area immediately surrounding the substation and is therefore localised.

A licensed waste management facility is located 399 m to the west of the site, but the licence was surrendered in 2014 and in any case, at such a distance is unlikely to have affected the site. The nearest area of infilled land (over water) is located 329 m to the southeast and is likely to relate to the infilling of a former pond or stream but again at such a distance is not considered to represent a risk to the site.

A Local Authority Pollution Prevention and Control point is authorised for a petrol filling station located 239 m to the southeast of the site, but is unlikely to affect the site at such a distance.

#### 2.6.2 Receptor

The proposed redevelopment of the site for residential purposes will result in the end users representing relatively high sensitivity receptors. Adjacent sites, buried services and concrete and construction workers are also receptors.

The site is underlain by Unproductive Strata and so groundwater is not likely to be present, but the site is within a Source Protection Zone and so groundwater is considered to be a sensitive receptor. The deep aquifer present within the chalk at depth is also considered to be a sensitive receptor.

#### 2.6.3 Pathway

Within the site, end users will be isolated from direct contact with any contaminants present within the made ground by the presence of the buildings and surrounding of the hardstanding, which will effectively form a barrier. End users could however come into contact with potentially contaminated soils via direct contact in areas of soft landscaping, although these are expected to be minimal and comprise managed communal space as opposed to private gardens, and so the potential for this pathway to exist will be limited. A pathway for accidental ingestion and direct contact would however be realised if the communal space were to comprise allotments or include space to grow produce.

The cohesive London Clay will prevent the migration of potentially contaminated groundwater to adjacent sites and onto the site from surrounding sources. The clay will also limit the potential for groundwater percolation into the underlying chalk, and thus a pathway is not considered likely to exist to the Principal Aquifer. Whilst the site is within a Source Protection Zone (SPZ), the London Clay is not capable of supporting flow to nearby water courses or abstraction points and therefore a pathway is not considered likely to exist to receptors within the SPZ. Where granular made ground is present, a pathway for the migration of perched water may exist, but this is unlikely to be extensive or continuous. Existing drainage runs and damaged drainage runs may also provide a pathway onto the site.

Buried services may be exposed to any contaminants present within the soil through direct contact and site workers will come into contact with the soils during construction works.

There is thus considered to be a low potential for a contaminant pathway to be present between any potential contaminant source and a target for the particular contaminant.

#### 2.6.4 Preliminary Risk Appraisal

Whilst the gas works to the north of the site is considered a significant source of contamination, a viable pathway whereby contamination could reach the site has not been identified and additionally, given the distance between the gas works and the site, the site is not considered to be at significant risk of contamination associated with the gas works. A viable pathway has also not been identified from the industrial uses and potential off-site sources of contamination to the north of the site.

On the basis of the above it is considered that there is a LOW risk of there being a significant contaminant linkage at this site that could result in a requirement for any remediation work.

### 3.0 SCREENING ASSESSMENT

A number of screening tools are included in the Arup report and reference has been made to Appendices E1, E2 and E3 which include a series of questions within screening flowcharts for surface flow and flooding, subterranean (groundwater) flow and land stability. The flowchart questions and responses to these questions are tabulated below.

Questions that relate specifically to sites in Camden have been omitted from the following assessment.

#### 3.1. Subterranean (groundwater) Screening Assessment

| Question                                                                                                                                                                                                   | Response for 9-30 Clarendon Road                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1a. Is the site located directly above an aquifer?                                                                                                                                                         | No. The London Clay Formation is a Non-Aquifer and Unproductive Stratum. See Aquifer designation map in the appendix.                                                                                                                                                                                                                                                                                   |
| 1b. Will the proposed basement extend beneath the water table surface?                                                                                                                                     | No. The London Clay does not support a continuous groundwater table due to the very low permeability (horizontal permeability of between $1 \times 10^{-11}$ m/s and $1 \times 10^{-9}$ m/s, with an even lower vertical permeability). Localised perched groundwater inflows maybe encountered from within the made ground, however these would not be prolonged, persistent or of substantial volume. |
| 2. Is the site within 100 m of a watercourse, well (used/disused) or potential spring line?                                                                                                                | No. The nearest surface water feature is the New River canal located 127 m to the south of the site. Whilst the site is within a Source Protection Zone, the London Clay cannot support groundwater flow to watercourses therefore no further assessment is required in this respect.                                                                                                                   |
| 4. Will the proposed basement development result in a change in the proportion of hard surfaced / paved areas?                                                                                             | No. There will not be an increase in impermeable area across the ground surface above the basement as the new building is expected to roughly follow the footprint of the existing buildings.                                                                                                                                                                                                           |
| 5. As part of the site drainage, will more surface water (e.g. rainfall and run-off) than at present be discharged to the ground (e.g. via soakaways and/or SUDS)?                                         | No. The London Clay has a very low permeability and is unlikely to be suitable for a soakaway or similar SUDS based system, therefore the site drainage will be directed to public sewer. Site drainage will therefore be designed to generally maintain the existing situation.                                                                                                                        |
| 6. Is the lowest point of the proposed excavation (allowing for any drainage and foundation space under the basement floor) close to or lower than, the mean water level in any local pond or spring line? | No. There are no groundwater fed ponds or spring lines supported by the London Clay within the vicinity of the site.                                                                                                                                                                                                                                                                                    |

The above assessment has not identified any potential issues with regard to the hydrogeological setting of the site.

### 3.2 Stability Screening Assessment

| Question                                                                                                                                                         | Response for 181 Cranley Gardens                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Does the existing site include slopes, natural or manmade, greater than 7°?                                                                                   | No. See topographical survey of the site appended to this report.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2. Will the proposed re-profiling of landscaping at the site change slopes at the property boundary to more than 7°?                                             | No. See appended proposed cross-section.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 3. Does the development neighbour land, including railway cuttings and the like, with a slope greater than 7°?                                                   | No. The nearest railway line embankment is located around 90 m to the west of the site, with buildings and Clarendon Road in between the embankment and the site.                                                                                                                                                                                                                                                                                                                                                              |
| 4. Is the site within a wider hillside setting in which the general slope is greater than 7°?                                                                    | No. As above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 5. Is the London Clay the shallowest strata at the site?                                                                                                         | <i>Yes. Reference to BGS maps of the area and BGS boreholes indicate that the site is underlain by the London Clay Formation from the surface.</i>                                                                                                                                                                                                                                                                                                                                                                             |
| 6. Will any trees be felled as part of the proposed development and / or are any works proposed within any tree protection zones where trees are to be retained? | No. It is understood that no trees are to be felled as part of the proposed development.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 7. Is there a history of seasonal shrink-swell subsidence in the local area and / or evidence of such effects at the site?                                       | No. Although the London Clay is known to be affected by seasonal shrink and swell of trees, there has not been any indication of previous movement taking place at the site.                                                                                                                                                                                                                                                                                                                                                   |
| 8. Is the site within 100 m of a watercourse or potential spring line?                                                                                           | No.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 9. Is the site within an area of previously worked ground?                                                                                                       | No. According to BGS maps of the area, the site is not within an area of previously worked ground.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 10. Is the site within an aquifer?                                                                                                                               | No. The site is underlain by Unproductive Strata.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 11. Is the site within 50 m of Hampstead Heath ponds?                                                                                                            | No.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 12. Is the site within 5 m of a highway or pedestrian right of way?                                                                                              | <i>Yes, the proposed basement will be within 5 m of the pathway to Clarendon Road bordering the site to the north, east and west.</i>                                                                                                                                                                                                                                                                                                                                                                                          |
| 13. Will the proposed basement significantly increase the differential depth of foundations relative to neighbouring properties?                                 | <i>Yes. It should be anticipated that the proposed basement will increase the depth of foundations relative to neighbouring properties including the Westpoint Apartments to the southwest, although it is likely that this six-storey apartment block is supported on piled foundations, office and warehouse style buildings to the north and west, and houses to the east. They are however at a distance of at least 5 m from the site, with the surrounding roads in between the site and the neighbouring buildings.</i> |
| 14. Is the site over (or within the exclusion zone of) any tunnels, e.g. railway lines?                                                                          | No. Ordnance Survey maps of the area and Transport for London's Property Asset Register indicate that the site is not over or within the exclusion zone of any tunnels.                                                                                                                                                                                                                                                                                                                                                        |

The above assessment has identified the following potential issues that need to be assessed:

- Q5 The London Clay is the shallowest stratum.
- Q12 The site is within 5 m of the pedestrian path to Clarendon Road to the north, east and west.
- Q13 The founding depth of the proposed basement will be at a lower depth than the neighbouring buildings.

### 3.3 Surface Flow and Flooding Screening Assessment

| Question                                                                                                                                                                                                                                                                                                           | Response for 45 Southwood Lane                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2. As part of the proposed site drainage, will surface water flows (e.g. volume of rainfall and peak run-off) be materially changed from the existing route?                                                                                                                                                       | No. There will not be an increase in impermeable area across the ground surface above the basement, so the surface water flow regime will be unchanged.<br>The basement will entirely be beneath the footprint of the proposed building/hardstanding, therefore the 1 m distance between the roof of the basement and ground surface as recommended by the Arup report and para 2.16 of the CPG4 does not apply.                                                                                                                                                                                                               |
| 3. Will the proposed basement development result in a change in the proportion of hard surfaced / paved areas?                                                                                                                                                                                                     | No. There will not be an increase in impermeable area across the ground surface above the basement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 4. Will the proposed basement development result in changes to the profile of the inflows (instantaneous and long term) of surface water being received by adjacent properties or downstream watercourses?                                                                                                         | No. There will not be an increase in impermeable area across the ground surface above the basement, so the surface water flow regime will be unchanged.<br>The basement will entirely be beneath the footprint of the existing building/hardstanding, therefore the 1 m distance between the roof of the basement and ground surface as recommended by the Arup report and para 2.16 of the CPG4 does not apply.<br>As the site and surrounding area is expected to be directly underlain by London Clay, groundwater is not likely to be flowing beneath or around the site and so the proposed basement will not alter flow. |
| 5. Will the proposed basement result in changes to the quality of surface water being received by adjacent properties or downstream watercourses?                                                                                                                                                                  | No. The proposed basement is very unlikely to result in any changes to the quality of surface water being received by adjacent properties or downstream watercourses.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 6. Is the site in an area identified to have surface water flood risk according to either the Local Flood Risk Management Strategy or the Strategic Flood Risk Assessment or is it at risk of flooding, for example because the proposed basement is below the static water level of nearby surface water feature? | The findings of this BIA together with the Haringey SFRA and Environment Agency online flood maps show that the site has a very low flooding risk from surface water. There will be a low flood risk from sewers, groundwater and reservoirs (and other artificial sources), and fluvial/tidal watercourses including culverted watercourses.<br>In accordance with paragraph 5.11 of the CPG a positive pumped device will be installed in the basement in order to further protect the site from sewer flooding.                                                                                                             |

The above assessment has not identified any potential issues with regard to the hydrological setting of the site.

## 4.0 SCOPING ASSESSMENT

The purpose of scoping is to assess in more detail the factors to be investigated in the impact assessment. Potential impacts are assessed for each of the identified potential impact factors.

### 4.1 Potential Impacts

The following potential impacts have been identified by the BIA screening process.

| Potential Impact                                                                      | Consequence                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The site is underlain by the London Clay Formation                                    | The BGS maps indicate the site to be directly underlain by the London Clay Formation. The London Clay is generally of high volume change potential and as such, is susceptible to seasonal shrink-swell which can result in differential settlements.                                                                                                                                                                       |
| The site is within 5 m of a highway of pedestrian or pedestrian right of way          | If the design of retaining walls and foundations did not take into account the presence of nearby infrastructure, it may lead to the structural damage of footway, highway and associated buried services.                                                                                                                                                                                                                  |
| The development will increase the differential founding depth of adjacent foundations | Having differential founding depths can result in differential settlements, which could arise from seasonal shrink and swell, if underlain by clay soils, or as result of the increased stiffness of underpinned foundations relative to those that remain unchanged. If not designed and constructed appropriately, the excavation of a basement may result in structural damage to neighbouring buildings and structures. |

These potential impacts have been assessed further below in Section 5.0 on the basis of the geological and hydrogeological setting of the site.

## 5.0 BASEMENT IMPACT ASSESSMENT

The screening identified a number of potential impacts. The desk study information, including the results of nearby site investigations, has been used below to review the potential impacts, to assess the likelihood of them occurring and the scope for reasonable engineering mitigation

### *The site is underlain by the London Clay Formation*

The presence of the London Clay can give rise to a number of potential issues with regard to excavation and construction of a new basement structure. These include slope instability on existing and new slopes greater than 7°, heave of the clay soils associated with the unloading from the basement excavation and shrinking and swelling of the clay soils due to the removal of trees. However, at this site no such slope angles already exist or will be created by the development and no trees are to be removed such that swelling of the clay subsoil will not be an issue. In addition, although the depth of the proposed basement will give rise to unloading of the clay and therefore heave movements and pressures, these heave movements are unlikely to be significant as they will, to a certain extent, be restricted by the loads applied by the construction of the new building.

Furthermore, there is nothing abnormal about the proposed basement development and there are well-established engineering solutions to mitigate heave movements, including void formers below the slab and the use of tension piles if necessary. Therefore, it is not considered likely that the excavation of the proposed basement will have an impact on the

existing building or on surrounding structures, provided that normal design and construction measures are taken to mitigate the impact.

*The site is located within 5 m of a public highway*

Whilst the existing building is within 5 m of the footpath and highway of Clarendon Road, there is nothing unusual about the proposed basement such that it would fall outside the scope of standard engineering practice and design. Provided that the design of the retaining walls takes into account any loading from the adjacent highway and the construction work is carried out in accordance with best practice, resulting ground movements should be within normal tolerable limits.

*Differential founding depths*

The new basement structure is expected to have a different founding depth to surrounding structures including the six-storey apartment block to the southeast, which is likely to be piled, and the houses to the northeast, which are probably supported on shallow foundations. Structures in the area therefore already have different founding depths. Additionally, surrounding buildings are at least 5 m away from the site and do not directly border the new building, being separated from the site by Clarendon Road. Underpinning will not therefore be required.

In any case and as stated above, provided that the new foundations are suitably designed using standard engineering practice, there is no reason for the basement excavation to result in excessive differential settlements and appropriate propping and temporary works installed during basement construction will limit the effect of ground movements on the surrounding properties. It is also likely that a programme of monitoring will be required during the groundwork to monitor ground movements associated with the excavation. It is anticipated that these matters can be dealt with by way of conditions on the planning consent.

## **6.0 DEVELOPMENT ISSUES**

The proposed development comprises the demolition of the existing buildings and the subsequent construction of a new development ranging between two and 14 storeys high, with a single level basement to be constructed beneath part of the new building. Loads for the new development are not known at this stage but are anticipated to be moderate to high and as such, piled foundations are likely to be required.

A ground investigation will need to be carried out in order to determine the ground conditions beneath the site. This will enable the bearing capacity and engineering properties of the soil to be determined and will also provide an opportunity to recover samples for contamination testing. Contamination testing will need to be carried out to determine the presence and extent of any contamination within the soils beneath the site and to subsequently recommend remedial action for the protection of site workers and end users, where necessary. It is possible that a clean cover system will need to be installed in order to ensure successful plant growth, and to ensure that end users cannot come into contact with physical hazards represented by any made ground if present, in areas of soft landscaping.

An asbestos survey should be carried out prior to any demolition works.

A Preliminary UXO Risk Assessment will be required before intrusive ground investigation works can commence. If this assessment indicates an elevated risk a more detailed assessment may be required and on-site supervision of intrusive work may be necessary.

## 7.0 CONCLUSIONS

From the desk study research and the information acquired, a continuous groundwater table will not exist below the site and so the proposed basement will not have an impact on the hydrogeological setting. The development will not increase the proportion of hardstanding across the site and so there will not be an increase in surface run-off and any surface waters will not be re-directed from the current drainage routes, which is likely to be to combined sewers in the road.

There is nothing unusual about the proposed single level basement scheme such that it would fall outside of standard engineering practice and design and therefore ground movements would be expected to remain within normal acceptable limits, which from previous experience, would not lead to unacceptable damage to neighbouring properties. On the basis of all of the above, it is not considered that the proposed basement will have an impact on either the hydrogeological and hydrological setting or the stability of the surrounding natural and built environment. A Ground Movement Assessment is likely to be required to assess the impact of the proposed basement excavation and construction on surrounding structures and will probably form a planning requirement.

On the basis of the findings of the research carried out there is considered to be a LOW risk of there being a significant contamination linkage at this site, and no requirement is envisaged for remediation in this respect.

# Envirocheck<sup>®</sup> Report:

## Datasheet

### Order Details:

**Order Number:**

270170592\_1\_1

**Customer Reference:**

J20293

**National Grid Reference:**

530940, 189520

**Slice:**

A

**Site Area (Ha):**

0.38

**Search Buffer (m):**

1000

### Site Details:

Clarendon Road  
Wood Green  
Haringey  
LONDON  
N8 0DJ

### Client Details:

Mr S Branch  
GEA Ltd  
Widbury Barn  
Widbury Hill  
Ware  
Herts  
SG12 7QE

#### Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

#### Natural England Copyright Notice

Site of Special Scientific Interest, National Nature Reserve, Ramsar, Special Protection Area, Special Conservation Area, Marine Nature Reserve data (derived from Ordnance Survey 1:10000 raster) is provided by, and used with the permission of, Natural England who retain the copyright and Intellectual Property Rights for the data.

#### Scottish Natural Heritage Copyright

Contains SNH information licensed under the Open Government Licence v3.0.

#### Ove Arup Copyright Notice

The Mining Instability data was obtained on licence from Ove Arup & Partners Limited (for further information, contact mining.review@arup.com). No reproduction or further use of such Data is to be made without the prior written consent of Ove Arup & Partners Limited. The supplied Mining Instability data is derived from publicly available records and other third party sources and neither Ove Arup & Partners nor Landmark warrant the accuracy or completeness of such information or data.

#### Stantec Copyright Notice

The cavity data presented has been extracted from the PBA (now Stantec UK Ltd) enhanced version of the original DEFRA national cavity databases. Stantec UK Ltd retain the copyright & intellectual property rights in the data. Whilst all reasonable efforts are made to check that the information contained in the cavity databases is accurate we do not warrant that the data is complete or error free. The information is based upon our own researches and those collated from a number of external sources and is continually being augmented and updated by Stantec UK Ltd. In no event shall Stantec UK Ltd or Landmark be liable for any loss or damage including, without limitation, indirect or consequential loss or damage arising from the use of this data.

#### Radon Potential dataset Copyright Notice

Information supplied from a joint dataset compiled by The British Geological Survey and Public Health England.

#### Natural Resources Wales Copyright Notice

Contains Natural Resources Wales information © Natural Resources Wales and Database Right. All rights Reserved. Contains Ordnance Survey Data. Ordnance Survey Licence number 100019741. Crown Copyright and Database Right. Contains Natural Resources Wales information © Natural Resources Wales and Database Right. All rights Reserved. Some features of this information are based on digital spatial data licensed from the Centre for Ecology & Hydrology © NERC (CEH). ## Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

### Artificial Ground and Landslip

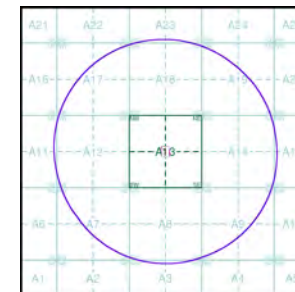

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

### Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

## Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

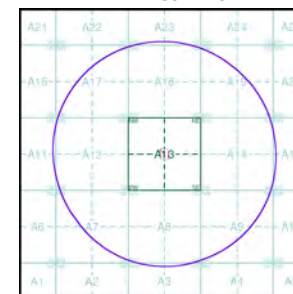

## Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

### Agency and Hydrological

#### Bedrock Aquifers

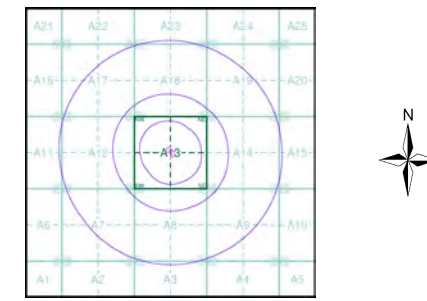

- High Vulnerability, Principal Aquifer
- High Vulnerability, Secondary Aquifer
- Medium Vulnerability, Principal Aquifer
- Medium Vulnerability, Secondary Aquifer
- Low Vulnerability, Principal Aquifer
- Low Vulnerability, Secondary Aquifer

#### Superficial Aquifers

- High Vulnerability, Principal Aquifer
- High Vulnerability, Secondary Aquifer
- Medium Vulnerability, Principal Aquifer
- Medium Vulnerability, Secondary Aquifer
- Low Vulnerability, Principal Aquifer
- Low Vulnerability, Secondary Aquifer

- Unproductive Aquifer
- Soluble Rock

## Sensitive Land Uses

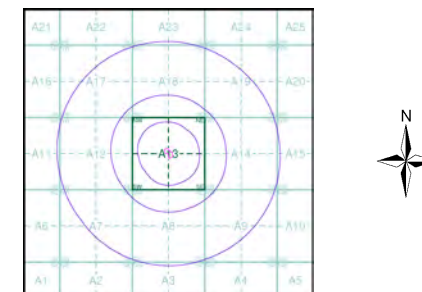

### General

- Specified Site
- Specified Buffer(s)
- Bearing Reference Point
- Slice
- Map ID

### Sensitive Land Uses

- Ancient Woodland
- Nitrate Sensitive Area
- Area of Adopted Green Belt
- Area of Unadopted Green Belt
- Area of Outstanding Natural Beauty
- Environmentally Sensitive Area
- Forest Park
- Local Nature Reserve
- Marine Nature Reserve
- National Nature Reserve
- National Park
- Nitrate Vulnerable Zone
- Ramsar Site
- Site of Special Scientific Interest
- Special Area of Conservation
- Special Protection Area
- World Heritage Sites

## BGS Flood GFS Data

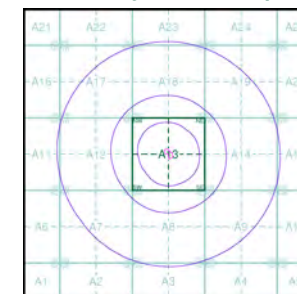

### General

- Specified Site
- Specified Buffer(s)
- Bearing Reference Point
- Slice

### Agency and Hydrological (Flood)

- Limited Potential for Groundwater Flooding to Occur
- Potential for Groundwater Flooding of Property Situated Below Ground Level
- Potential for Groundwater Flooding to Occur at Surface
