1.0 INTRODUCTION

1.1 GENERAL

National Grid are proposing to demolish the existing welfare building within their Tottenham Substation and construct a replacement welfare building for continued commercial end-use.

Intégral Géotechnique (Wales) Limited have been appointed as the Geotechnical Engineers to undertake a geoenvironmental desk study as part of a Phase 1 contaminated land assessment for the site. This is in order to satisfy the requirements of Haringey Council for information to be submitted with planning applications, which was adopted on 31st July 2019.

The objectives of the geoenvironmental appraisal are to:

- Assess the degree, nature and extent of possible contamination and its implications for ownership and site development; and
- Identify any geoenvironmental constraints on development.

This report presents the findings of the desk study, and provides guidance for the geoenvironmental aspects of the proposed site development.

It should be noted that this report does not consider any geotechnical matters at the site.

The opinions and preliminary assessments presented are based on desk-based research and should be reviewed after intrusive investigation, if deemed necessary.

This report (including all appendices to it and any subsequent addendums or correspondence) has been prepared for the sole benefit, use and information of National Grid and no third party is entitled or permitted to rely on it. This report may not be used, reproduced or circulated (in whole or part) for any purpose without the written consent of Intégral Géotechnique (Wales) Limited. Intégral Géotechnique (Wales) Limited shall not be liable to any third party who does not have such express written permission to rely on the report for any losses they may suffer.

1.2 PROPOSED DEVELOPMENT

The proposed development will comprise the demolition of the existing single storey welfare facilities building and construction of a new welfare and office building, approximately at the same location.

1.2 PROPOSED DEVELOPMENT (CONTINUED)

The new building will comprise a two-storey modular and pre-fabricated structure and be slightly larger than the original building occupying an area of approximately 180 sq.m.

New car parking areas and grassed landscape areas will also be provided as part of the development.

1.3 SCOPE OF WORKS

The work instructed included a geoenvironmental desk study of available information, together with the development of an initial conceptual site model. The desk study comprised a review of:

- An Envirocheck Report obtained for the site;
- Old Ordnance Survey maps covering the site, included within the Envirocheck Report;
- A Radon Report obtained from the British Geological Survey;
- Geological maps of the area provided by the British Geological Survey;
- The Environment Agency groundwater vulnerability map and aquifer database for the area; and
- Existing site investigation data (if available)

1.4 LIMITATIONS

This document is intended to be a working document for further development in discussion with all concerned including the Local Planning Authority and the Environment Agency as appropriate.

“Contamination” is taken throughout the report to mean the “presence of one or more potentially harmful substances as a result of human activity”. The use of the term in this way does not imply that harm is being or might be caused by the contamination. It should be noted that “contamination” can have different meanings under different regulatory regimes, for example, planning, building control and Part IIA of the Environmental Protection Act 1990. Naturally elevated concentrations of potentially harmful substances may also be of concern and the significance of any that have been found is also evaluated in this report.

2.0 THE SITE

2.1 SITE LOCATION AND DESCRIPTION

The site is located within the southwest area of the large substation site off Watermead Way in Tottenham at a National Grid Reference of 535190, 191270, see Figure 1.

The development area is irregular in shape and occupies an area of approximately 0.13 hectares. The boundaries of the site are defined by existing large reactor buildings to the north, east and southeast and Watermead Way to the west. A site plan is presented in Figure 2.

The site is located on relatively level low-lying ground at an approximate elevation of 10m AOD.

The development area is occupied by the existing single storey flat roofed welfare building which is approximately 3m in height. There are grassed areas around the welfare building and an access road to the west and north to reach the car parking area to the rear of the large reactor building and to the east of the welfare building.

2.2 SITE OPERATIONS

The building currently present on site is utilised as a welfare unit. The wider site area is owned and operated by National Grid as a fully operational substation.

2.3 SURROUNDING LAND USE

The surrounding areas generally form the rest of the substation. The area beyond the substation to the north is developed for commercial use within Mowlem Trading Estate and with further commercial development beyond Watermead Way to the west.

2.4 AVAILABLE SITE INVESTIGATION DATA

There is no intrusive site investigation data for the site that has been made available to us.

3.0 SITE HISTORY

The recent history of the site has been traced with the aid of an Envirocheck Report, a copy of which is included in Appendix A. The Envirocheck Report includes the following scaled historical maps:

Map Scale	Dates
1:1,056	1895
1:2,500	1880-1886, 1881, 1896, 1915, 1935, 1956-1957, 1957, 1969
1:1,250	1955-1956, 1967-1971, 1974, 1991, 1999(aerial photo)
1:10,560	1868-1873, 1872-1879, 1896, 1898, 1920, 1938, 1945-1950
1:10,000	1962-1968, 1975-1977, 1990-1995, 1999, 2006, 2020
1:25,000	1985

The earliest edition of the map dated 1880-1886 indicated the site and the surrounding area to be undeveloped fields lined with drainage channels, including one crossing the site on a north to south orientation. The area was low lying and known as Tottenham Marsh with a larger surface water feature located approximately 120m to the east. The site was located in between the Great Eastern Railway (Cambridge Line) approximately 190m to the west and the River Lea Navigation (canalised river incorporating the River Lea) approximately 340m to the east. Tottenham was well-established beyond the railway line to the west of the site. The nearest development at this time was Asplin Farm located approximately 250m to the southwest.

The 1896 edition of the map indicated the site and the immediate surrounding area to have remained relatively unchanged. The surface water feature to the east was indicated to be known as Pymme's Brook. Tottenham had extensively developed and expanded beyond the railway line to the west.

There were no significant changes within the site or the surrounding areas over the subsequent years. A new cut of the River Lea had been constructed parallel to the canal by 1915.

The edition of the map dated 1935 indicated the site to have remained undeveloped but a shoe factory had been constructed approximately 60m to the southwest of the site. The railway to the west was now known as the London and North Eastern Railway.

3.0 SITE HISTORY (CONTINUED)

The edition of the map dated 1956-1957 indicated the surface water feature which crossed the site to have been infilled and was no longer evident, but the site remained undeveloped. Extensive commercial development, which comprised the construction of various works buildings, had taken place to the west and southwest of the site. The closest works to the site included a Paper and Stationery Works, a Blouse and Lingerie Works, and a Moulded Fibre Goods Works. There was evidence of earthworks around the perimeter of this development, approximately 10m to the west of the site. The areas to the north, east and south of the site remained undeveloped, with the area further away to the south utilised as a recreation ground.

By the edition of the map dated 1967-1971 significant development had been undertaken within and around the site with the construction of the Electricity Transformer Station. A small building was constructed within the site and larger buildings bounded the site to the north and southeast. Additional commercial development had also taken place further to the north and with the area further to the south still utilised as a recreation ground. The previous industrial units closest to the site were now operated as a Cardboard factory, a Warehouse and a Sheet Metal Works.

The site and the surrounding electricity substation site remained relatively unchanged over the subsequent years. Commercial development continued to the north of the substation throughout the 1980's and 1990's. By the 2000's the building on site had been extended to create the building which currently occupies the site.

4.0 SITE ENVIRONMENTAL SETTING

4.1 PHYSICAL SETTING

The site is located within the existing substation compound on relatively level low-lying ground at an approximate elevation of 10m AOD.

Pymme's Brook flows along the eastern edge of the substation site.

4.2 GEOLOGY

The 1:50,000 scale geological map of the area indicates the site to be underlain by London Clay Formation of the Palaeogene period. These rocks typically comprise bioturbated or poorly laminated, blue-grey or grey-brown, slightly calcareous, silty to very silty clay, clayey silt and sometimes silt, with some layers of sandy clay. It also includes a few thin beds of shells and fine sand partings or pockets of sand, which commonly increase towards the base and towards the top of the formation.

Superficial deposits of Alluvium of the Quaternary period are indicated to overlie the solid strata across the majority of the site. The western corner of the site is indicated to be overlain by Enfield Silt Member also of the Quaternary period. Alluvium is a general term for clay, silt, sand and gravel. It typically comprises soft to firm consolidated, compressible silty clay, but can contain layers of silt, sand, peat and basal gravel. A stronger, desiccated surface zone may be present. The Enfield Silt Member varies from silt to clay and is commonly yellow-brown in colour.

Made ground is likely to be encountered above the superficial deposits, associated with the construction of the existing building, but would not be anticipated to be significant.

A summary of the anticipated geological succession is given below in Table 1.

Table 1: Summary of Anticipated Site Geology		
Geological unit	Horizon	Description
Recent	Made ground	Various materials
Quaternary	Alluvium	Soft to firm consolidated, compressible silty clay, but can contain layers of silt, sand, peat and basal gravel. A stronger, desiccated surface zone may be present

4.2 GEOLOGY (CONTINUED)

Table 1: Summary of Anticipated Site Geology (Continued)		
Geological unit	Horizon	Description
Quaternary	Enfield Silt Member (western corner)	Varies from silt to clay and is commonly yellow-brown in colour
Palaeogene	London Clay Formation	Bioturbated or poorly laminated, blue-grey or grey-brown, slightly calcareous, silty to very silty clay, clayey silt and sometimes silt, with some layers of sandy clay. It also includes a few thin beds of shells and fine sand partings or pockets of sand, which commonly increase towards the base and towards the top of the formation

4.3 RADON

Information with regard to Radon Protective Measures is provided within the Envirocheck Report and the BGS Radon Report as presented in Appendix B. The reports state that the site is within a lower probability area, as less than 1% of properties are above action level, and that therefore no radon protective measures would be necessary in the construction of new buildings within the site.

4.4 MINING

The site is not located within an area that would be affected by past, present or future underground mining.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK

The Envirocheck report records the nearest water feature to be located 124m to the east of the site. The OS Water Network Lines map indicates this to be Pymme's Brook. The River Lea and the River Lea Diversion flow 345m and 380m to the southeast respectively.

The Environment Agency groundwater vulnerability map and aquifer database classifies the bedrock beneath the site as Unproductive Strata. Unproductive strata are rock layers with low permeability that have negligible significance for water supply or river base flow.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK (CONTINUED)

The Environment Agency groundwater vulnerability map and aquifer database classifies the Alluvium deposits beneath the majority of the sites as a Secondary 'A' Aquifer. Secondary 'A' Aquifers are permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers. The Enfield Silt Member, beneath the western corner, has been classified as Unproductive Strata.

A perched water body could be encountered within any made ground due to the relatively impermeable nature of the underlying superficial deposits.

It is considered possible that any existing site drainage could act as a pathway for potential surface contaminants.

The Envirocheck Report indicates that there are no discharge consents recorded within 500m of the site boundary.

The Envirocheck Report states that there are three water abstractions recorded within 500m of the site boundary. The nearest is a single point groundwater abstraction recorded 162m to the west from a borehole at Empire Laundry, with the water used by the laundry. Another two groundwater abstractions are recorded 374m to the southwest and 473m to the south where Thames Water Utilities Ltd have single point abstraction points with the water used for potable public water supply.

Tables 2 and 3 present a summary of the hydrological features and key hydrogeological nature of the site.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK (CONTINUED)

Table 2: Summary of Site Hydrology					
Feature	Distance from site	Flow	Classification	Abstraction	Discharge
Pymme's Brook	124m east	Southerly	Brook	No	River Lea
River Lea and River Lea Diversion	345m and 380m southeast	Southerly	Inland River	No	River Thames
Surface run-off	On site	Flows into site drainage	N/A	No	Not known
Site Drainage	On site	Not known	N/A	No	Not known

Table 3: Summary of Site Hydrogeology				
Geological Unit	Aquifer Classification	Aquifer Characteristics	Source Protection Zone	Groundwater Abstractions
Made ground	Not classified	Highly variable permeability and porosity. Perched water may be present with variable flow directions.	Yes	None
Alluvium	Secondary A Aquifer	Variable moderate permeability and porosity with intergranular flow possible. High clay content likely to restrict flow.	Yes	None
Enfield Silt Member	Unproductive Strata	Negligible permeability. High clay content likely to restrict flow.	Yes	None
London Clay Formation	Unproductive Strata	Negligible permeability clays and silts	Yes	**None

** Groundwater abstractions recorded 162m west, 374m south and 473m south of the site. None recorded on site.

The Groundwater Vulnerability map of the area indicates the secondary superficial aquifer to have a high vulnerability. The pollutant speed is high with a mixed flow. Beneath the western corner of the site the superficial aquifer is indicated to be unproductive. The bedrock aquifer is unproductive across the site.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK (CONTINUED)

The Environment Agency Flood Risk Map as presented within the Envirocheck Report indicates that the site is at risk to extreme flooding from rivers or sea without defences.

The Environment Agency Surface Water Flood Risk map as presented within the Envirocheck Report indicates that the site is not at a high risk to surface water flooding (30-year flood extent).

The BGS Groundwater Flooding Susceptibility Map indicates the site to have potential for groundwater flooding to occur at surface.

4.6 LANDFILL SITES

The Envirocheck Report indicates that there are no historical, BGS recorded or current landfill sites located within 500m of the site boundary.

There are no Licensed Waste Management Facilities or Registered Waste Transfer Sites recorded within 250m of the site boundary.

There are records of potentially infilled land (water) within 250m of the site boundary, including one area crossing the western area of the site. These are indicated at the location of former surface water features which have been infilled.

4.7 POTENTIAL CONTAMINATION

Previous Uses

The various activities in the vicinity of the site which may have resulted in ground or water resource contamination on this site are listed below in Tables 4 and 5. A summary of the potential contaminants can be found in the tables.

4.7 POTENTIAL CONTAMINATION (CONTINUED)

Table 4: Potential Contaminants		
Land Use: Undeveloped land until the 1960's		
Material/Process	Contamination/Hazard	Evidence
Possible agricultural land	No potential contaminants	Historical maps
Infilling of the surface water feature which crossed the site by the 1940's. Possible use of imported materials of unknown origin	Metals, semi metals, non-metals, PAH, asbestos	Anecdotal
Land Use: Construction of the building within Electricity Transformer Station by 1960's		
Material/Process	Contamination/Hazard	Evidence
Imported made ground/earthworks and ground disturbance as part of the construction works within the site and the immediate surrounding areas	Metals, semi metals, non-metals, PAH, asbestos	Historical maps
Further ground disturbance caused by the extension to the building during the 2000's	Metals, semi metals, non-metals, PAH, asbestos	Historical maps and images

Existing Uses

The single storey building which currently occupies the site is utilised as a welfare facility within the larger substation site. The area to the east of the building is utilised for car parking.

Adjacent Site Uses

Table 5: Potential Contaminants: Adjacent Site Uses		
Potential Contamination Source	Boundary	Associated Contaminants and Hazards
Existing large substation reactor buildings	Northern and eastern	No Potential Contaminants
Undeveloped area of the substation site	Southern	No Potential Contaminants
Access road with Watermead Way beyond	Western	No Potential Contaminants

4.8 OTHER ENVIRONMENTAL ISSUES

Environmentally sensitive land has been identified in close proximity of the site. The area directly to the south of the substation and the area to the east of Pymme's Brook are areas of adopted green belt.

The site and the surrounding areas are also located with a Nitrate Vulnerable Zone. A nitrate vulnerable zone is a conservation designation of the Environment Agency for areas of land that drain into nitrate polluted waters, or waters which could become polluted by nitrates.

There is one active Local Authority Pollution Prevention and Control in place within 250m of the site boundary. Spraytech are authorised for the respraying of road vehicles 128m to the north of the site.

The Envirocheck Report indicates that there have been no pollution incidents to controlled waters recorded on site or within 250m of the site boundary and no significant incidents recorded within 500m of the site boundary. The nearest incident was a Category 3-Minor Incident recorded 353m to the northeast of the site involving urban run-off.

There have been no prosecutions relating to controlled waters or to authorised processes recorded on site or within 250m of the site boundary. The nearest prosecution relating to authorised processes was recorded 345m to the north of the site. A guilty verdict was reached and a fine issued for illegally burning and storing waste on land without a waste management licence.

There have been no substantiated pollution incidents registered on site but one recorded within 250m of the site boundary. The incident involving contaminated water from firefighting run-off was recorded 91m to the southwest of the site and caused a major impact on water, a significant impact on air and a major impact on land.

The site and surrounding area are located within a Source Protection Zone, Zone 1 (Inner Protection Zone). The Environment Agency have defined Source Protection Zones (SPZs) for groundwater sources such as wells, boreholes and springs used for public drinking water supply. These zones show the risk of contamination from any activities that might cause pollution in the area. Zone 1 is defined as the 50-day travel time from any point below the water table to the source. This zone has a minimum radius of 50 metres.

4.8 OTHER ENVIRONMENTAL ISSUES (CONTINUED)

There are a number of active contemporary trade directory entries within 250m of the site boundary as would be expected within a commercially developed area with existing industrial estates to the north and west. Entries include an office furniture and equipment business, a textile printer and a chemist and pharmacist supplier.

The Envirocheck Report indicates underground electrical cables to be present beneath the site.

5.0 PRELIMINARY CONCEPTUAL SITE MODEL

5.1 RISK ASSESSMENT FRAMEWORK

In order to be consistent with current UK government policies and legislation, it is necessary to identify, assess, estimate, evaluate, and take appropriate action to deal with land contamination, in accordance with the procedures specified in the Environment Agency guidance Land Contamination Risk Management (LCRM) published in October 2020. This replaces the now withdrawn 'Model Procedures for the Management of Land Contamination CLR-11' (Environment Agency 2004).

The risk assessment process is designed to provide a reasoned, structured and pragmatic mechanism for the identification of any potential human health and controlled waters risks associated with land contamination and where necessary to develop a robust remediation strategy to ensure protection of the sensitive receptors (human health of future residents, controlled waters, etc).

In accordance with LCRM, the term 'land contamination' is defined as:

- All land affected by contamination – land that might have contamination present which may, or may or may not, meet the statutory definition of contaminated land,
- Land determined as contaminated land under Part 2A of the Environmental Protection Act 1990.

LCRM provides a tiered approach to risk assessment, comprising a preliminary risk assessment (including the development of an initial conceptual site model), a generic quantitative risk assessment and a detailed quantitative risk assessment. For each tier of risk assessment, the following steps must be followed:

1. Identify the hazard - establish contaminant sources,
2. Assess the hazard – use a source-pathway-receptor linkage approach to determine if there is potential for unacceptable risk,
3. Estimate the risk – predict what degree of harm or pollution may result and how likely it is to occur, and
4. Evaluate the risk – decide whether a risk is unacceptable.

LCRM also provides definitions of the following terms:

- Hazard – a property or situation that in particular circumstances could lead to harm or pollution,

5.1 RISK ASSESSMENT FRAMEWORK (CONTINUED)

- Risk – a combination of the probability, or frequency of occurrence of a defined hazard and the magnitude of the consequences of the occurrence,
- Risk assessment – the formal process of identifying, assessing and evaluating the health and environmental risks that may be associated with a hazard,
- Risk management – the formal process to identify, assess and determine the risks, and to select and take action to mitigate them.

The three essential elements to any risk are defined by LCRM as follows:

- A contaminant, or pollutant, that is in, on, or under the land and that has the potential to cause harm, or pollution (Source)
- A route by which a receptor is, or could be affected by a contaminant (Pathway)
- A receptor, i.e. something that could be adversely affected by a contaminant, for example a person, controlled waters, an organism, an ecosystem, or Part 2A receptors such as buildings, crops or animals (Receptor).

In order for there to be a potential risk, all three of the above elements must be present. If there is a source of contamination and a receptor (for example a resident or site user), then there is only a potential risk if there is a pathway linking the two. Such an active pathway is known as a relevant pollutant linkage. It is possible for the same contaminant to be linked to a receptor via a number of pathways, and hence it is important that all relevant pollutant linkages, to both human health and controlled waters, are separately identified on a site in order that a comprehensive conceptual model can be formed and ultimately a robust remediation strategy designed.

Current practice during Generic Quantitative Risk Assessment of land affected by contamination is to use generic soil screening values based on the appropriate proposed end use. These usually comprise risk-based Soil Guideline values (SGVs) or Generic Assessment Criteria (GACs) derived by the Environment Agency's Contaminated Land Exposure Assessment Model (CLEA). The SGVs and the supporting technical guidance were developed in order to assist in the assessment of long-term risk to human health from the exposure to contaminated soils.

Revised Statutory Guidance, published in 2012, to support Part 2A of the Environmental Protection Act 1990, introduced a new four category system for classifying land under Part 2A. Category 1 includes land where the level of risk is clearly unacceptable and Category 4 includes land where the level of risk posed is considered to be acceptably low. Under Part 2A, land would be determined as contaminated if it falls within Categories 1 or 2.

5.1 RISK ASSESSMENT FRAMEWORK (CONTINUED)

The revised Part 2A Statutory Guidance was accompanied by an Impact Assessment that identified a role for new 'Category 4 Screening Levels' (C4SLs) that would provide a simple test for determining when land is suitable for use and definitely not contaminated land. A Policy Companion Document including the C4SLs was published in March 2014 (England) and May 2014 (Wales).

The C4SLs have been based on the CLEA methodology and derived using the CLEA model, with modified toxicological and exposure parameters. To date, C4SLs have been released for six substances (arsenic, cadmium, chromium (VI), lead, benzo(a)pyrene and benzene).

The C4SLs have been derived on the assumption that where they exist, they will be used as generic screening criteria within generic quantitative risk assessment.

Following publication of the C4SLs, Land Quality Management (LQM), in conjunction with the Chartered Institute for Environmental Health (CIEH) released Suitable 4 Use Levels (S4ULs) in January 2015.

The S4ULs have been derived in accordance with UK legislation, and using a modified version of the Environment Agency's CLEA software. As such, the S4ULs are based on the concept of minimal or tolerable risk as described in Human Health Toxicological Assessment of Contaminants in Soil (Science Report SR2, Environment Agency 2009a).

S4ULs have been derived for a wider number of substances.

In addition to the existing SGVs, C4SLs and S4ULs, Atkins ATRISK^{soil} also provide a set of Soil Screening Values. These are currently intended to be used in conjunction with SGVs, although they intend to update these values in line with the C4SLs in due course.

We have reviewed all sets of values and intend to use the most appropriate assessment criteria as Tier 1 screening values in the first instance. Where a published S4UL is available, and considered appropriate, this will be used in the first instance.

5.2 CONCEPTUAL MODEL FRAMEWORK

The preliminary stage of the risk assessment process is to develop and define a conceptual site model, based on the desk study and any existing site investigation data. This is used to establish any potential contaminant sources, identify existing and future receptors and assess if there are any potentially active pathways by which a potential risk may be present.

5.2 CONCEPTUAL MODEL FRAMEWORK (CONTINUED)

The preliminary conceptual site model will be developed and refined as site specific data is gathered, such as actual ground conditions and chemical data, resulting in a more robust conceptual understanding of the site.

5.3 CRITICAL SENSITIVE RECEPTOR – HUMAN HEALTH

The proposed redevelopment of the site is for continued commercial end use. Therefore, the critical sensitive receptor from a human health perspective is an on-site commercial receptor.

In accordance with S4UL/C4SL and CLEA guidance for a standard commercial scenario, the critical sensitive receptor for a commercial end use risk assessment is a female adult, with exposure from 16 to 65 years.

The standard commercial end-use conceptual model defined by S4UL/C4SL and CLEA is assumed to be suitable for the purposes of this assessment.

5.4 CRITICAL SENSITIVE RECEPTOR – CONTROLLED WATERS

Based on the proposed redevelopment of the site for a commercial end use, and the findings of the desk study, the critical sensitive receptor from a controlled water perspective is groundwater within the Secondary 'A' Aquifer of the superficial Alluvium deposits.

By considering groundwater as the critical sensitive receptor for controlled waters, the groundwater/hydrogeological risk assessment will also be protective of any nearby surface water features, with the nearest being Pymme's Brook to the east.

5.5 POTENTIAL CONTAMINANT SOURCES

As identified in the desk study, the site remained undeveloped until the construction of the substation, including the welfare unit which occupies the site, during the 1960's. This building was indicated to have been extended during the 2000's. A small surface water feature was also indicated to have been infilled circa 1940's

Where made ground is encountered, the potential types of contaminants of concern are listed below:

5.5 POTENTIAL CONTAMINANT SOURCES (CONTINUED)

- Metals, semi-metals, and inorganics within the shallow made ground;
- Polyaromatic hydrocarbons (PAH) within the shallow made ground; and
- Asbestos within the shallow made ground and also within the building fabric.

5.6 POTENTIAL EXPOSURE PATHWAYS

Potential exposure pathways for the critical receptors (both human health and controlled waters) are listed below:

- Dermal contact with soil and/or soil derived dust;
- Ingestion of soil;
- Inhalation of soil derived dust;
- Inhalation of vapours – indoor and outdoor air;
- Leaching of contaminants from made ground to groundwater; and
- Transportation of contaminants within groundwater.

In addition, the following exposure pathways have also been considered:

- Ground gas generation and migration; and
- Building materials durability.

5.7 SUMMARY OF CONCEPTUAL EXPOSURE MODEL

A preliminary conceptual exposure model has been developed for the site. This is based on the findings of the desk study and historical review and includes all potential sources, pathways and receptors that may be present on site. Those that have been identified as being potentially active may require further investigation in the form of sampling and testing of soils and/or groundwater as necessary, followed by appropriate risk assessment, if significant made ground and/or evidence of suspected contamination is encountered.

The preliminary conceptual exposure model could be reviewed and refined following the completion of any site works and laboratory testing, if required or deemed necessary prior to development.

The preliminary conceptual exposure model is presented below in Table 6.

5.7 SUMMARY OF CONCEPTUAL EXPOSURE MODEL (CONTINUED)

Table 6: Preliminary Conceptual Exposure Model				
Source		Receptor	Pathway	Potentially Active Pathway?
Origin	Contaminant			
Made Ground of unknown origin and historical land uses (not anticipated to be significant)	Metals, semi-metals, non-metals, PAH, asbestos	Commercial – human health	Dermal Contact with made ground/dust	✓*
			Ingestion of soil	✓*
			Inhalation of dust	✓*
			Inhalation of vapours – indoor/outdoor	✓*
	Metals, semi-metals, inorganics, PAH	Groundwater quality	Leaching from made ground	X Low permeability alluvial clays will inhibit groundwater flow
	Metals, semi-metals, inorganics, PAH	Surface water quality	Transportation within groundwater	X Low permeability alluvial clays will inhibit groundwater flow
Asbestos or ACM within the building fabric	Asbestos/ACM	Commercial – human health	Inhalation of dust	✓ Subject to findings of Refurbishment/Demolition Survey
Made Ground of unknown origin and natural ground	pH and water-soluble sulphate	Building Materials Durability	Direct contact	✓ Concrete classification required
Ground Gas – organic, gas producing materials	Methane, carbon dioxide	Human health	Accumulation of gases in confined spaces, and/or migration off site, leading to asphyxiation, or risk of explosion	X Significant gas generating materials not anticipated on site. However, if excessive organic materials are noted within the alluvium deposits then consideration may need to be given to gas monitoring or appropriate mitigation measures. No off-site sources noted.

* Note potential active pathways identified above would depend on the encountered ground conditions and the presence, or otherwise, of made ground and evidence of suspected contamination.

5.7 SUMMARY OF CONCEPTUAL EXPOSURE MODEL (CONTINUED)

The site does not have a history of past potentially contaminative end uses, having remained as undeveloped prior to its current use and therefore the potential for contaminated ground to be encountered is considered to be low, and, with an appropriate watching brief, the site could be safely developed for continued commercial use.

6.0 ANTICIPATED GROUND CONDITIONS

Based on the geological map data, historical records and available site investigation data, the following general succession of superficial deposits and underlying solid geology beneath the site is anticipated:

Recent Reworked materials/made ground.

Quaternary

(Alluvium-majority of site) Soft to firm consolidated, compressible silty clay, but can contain layers of silt, sand, peat and basal gravel. A stronger, desiccated surface zone may be present

(Enfield Silt Member-western corner) Varies from silt to clay and is commonly yellow-brown in colour

Palaeogene

(London Clay Formation) Bioturbated or poorly laminated, blue-grey or grey-brown, slightly calcareous, silty to very silty clay, clayey silt and sometimes silt, with some layers of sandy clay. It also includes a few thin beds of shells and fine sand partings or pockets of sand, which commonly increase towards the base and towards the top of the formation

The site has a limited site history and therefore made ground would not be anticipated to be significant and is likely to be associated with the construction of the existing building.

Localised seepages of perched groundwater could be encountered in the shallow soils/made ground due to the low permeable nature of the underlying alluvium deposits.

7.0 SITE ASSESSMENT

7.1 ENVIRONMENTAL RISK ASSESSMENT

This assessment takes due regard of Contaminated Land Guidance issued by DEFRA and RICS. The methods used follow a risk-based approach with the potential environmental risk assessed qualitatively using the 'source-pathway-receptor' pollutant linkage concept set out in the Environment Protection Act 1990.

Although the risk presented in the following tables and above is descriptive, it is correlated to a numerical chance of occurrence. Therefore, the range and percentage chance of occurrence is given in order that the reader may assess the datum for the risk level. Although the percentage chance is quoted, this is still a subjective evaluation and is not prepared by probabilistic determination. Therefore, the chance of occurrence is a value judgement and not a numerical calculation. The evaluation is a simple qualitative risk assessment, which cannot make a judgement on the probability of occurrence or level of contamination. The latter two aspects require site specific information.

Reference to risk classifications is made according to the following definitions.

Low Risk	It is unlikely that the issue will arise as a liability/cost.
Medium Risk	It is possible that the issue could arise as a liability/cost. Further work is needed to clarify the risk and consequences.
High Risk	It is likely that the issue will arise as a liability/cost.

In consideration of the information gathered and presented in this report the following risk appraisal is considered appropriate.

Table 7: Environmental Risk Assessment		
Issue	Risk Category	Comments
<i>Site sensitivity</i>		
Sensitivity of site location	Medium	Site is located within a 'groundwater source protection zone' and a 'nitrate vulnerable zone'
Environmental sensitivity of adjacent land uses	Low	Site situated in a commercially developed area and within the grounds of the existing substation

7.1 ENVIRONMENTAL RISK ASSESSMENT (CONTINUED)

Table 7: Environmental Risk Assessment (Continued)		
Issue	Risk Category	Comments
Contamination potential		
Potential for significant on-site contamination	Low/medium	• Site currently occupied by a building with the site undeveloped prior to that • Potential for made ground associated with the development • Potential for contamination associated with building fabric (asbestos)
Potential for contaminants migrating off from the site	Low	
Potential for contaminants migrating onto the site	Low	
Potential for other environmental issues to give rise to liabilities	Low	
Environmental Consequences		
Risk of pollution of controlled waters	Low	• Any made ground encountered beneath the site is not anticipated to be significant and likely to be associated with the construction of the building. Site underlain by relatively impermeable alluvium deposits
Risk of damage to future property	Low	
Risk of harm to human health	Low	
Business Consequences		
Risk of liability for owner	Low	• Previous and current land use not likely to produce significant contaminants
Likelihood of designation as Contaminated Land under EPA 1990	Low	
Risk of site value and/or saleability being affected	Low	
Overall Risk	Low/medium	

8.0 CONCLUSIONS

The desk study research has not indicated any past contaminative uses for the site with the area remaining undeveloped up until the construction of the original welfare unit in the 1960's.

Made ground would be anticipated associated with the construction of the building but would not be anticipated to be significant. The current and past site uses would not generate a significant contamination potential. If made ground is encountered during the construction works it is recommended that there is a watching brief to report any unusual materials and allowances made for localised testing if deemed appropriate. It is unlikely that any contaminants would leach from any made ground due to the relatively impermeable nature of the underlying superficial deposits.

An asbestos and materials survey should be undertaken for the existing building, to ensure a safe and appropriate demolition strategy is devised. Any asbestos or Asbestos Containing Material (ACM) should be removed by an appropriately licenced contractor if it is found to be present.

Although the potential risk from ground gas is considered to be low, if significant organic materials are noted within the in-situ alluvial deposits then consideration may need to be given to a period of gas monitoring or the inclusion of appropriate mitigation measures within the building.

In conclusion, it is considered that significant contamination would not be anticipated within the site and, with an appropriate watching brief for all the points raised above, could be safely developed for continued commercial use. Allowances should be made for appropriate laboratory chemical testing should excessive made ground, or unusual materials, be encountered during construction works.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.
