

Solar Panel Illustration for 14 Kingsley Place

This photograph is provided as an illustrative example of the proposed panel type, low-profile mounting approach, dark framing, and dark edge treatment. It is not a photograph of 14 Kingsley Place and is not intended to show the precise layout proposed for the application site.

At 14 Kingsley Place, the panels would be set back from the roof edges and grouped in an orderly arrangement on the flat roof. The proposed specification uses dark, matte, non-reflective panels and matching dark framing/flashings, so that the installation reads as a recessive roof-level element.

The proposed arrangement has been selected to balance renewable-energy generation with visual amenity and conservation-area considerations. In particular, the layout responds to the site constraints, including the need to avoid significant shading from the adjacent mature tree canopy, while minimising the visual prominence of the installation as far as practicable.
