PHASE 1 & 2 SITE INVESTIGATION REPORT

10-16 ASHFIELD ROAD, FINSBURY PARK, N4 1PB

1 INTRODUCTION

The Brownfield Consultancy was instructed by Primehouse Ltd to carry out a Phase 1 and 2 Site Investigation Report at the above site. The site currently comprises of a number of lock-up Garages.

Planning permission has been obtained for the '*demolition of the existing garages and the construction of 3 x 4 bedroom houses, single storey in height, each with a basement*'. (Haringey Council Ref: HGY/2020/3271). The residences will be constructed within a single, triangular shaped basement area extending to approximately 3m below existing ground level. The lower floor will be at basement level, approximately 3m below existing ground level. The proposals are presented in Appendix A.

The purpose of the desk top study and site investigation is to provide an assessment of the extent of any soil and groundwater contamination at the site and provide geotechnical recommendations. A remediation method statement is also provided which aims to address identified pollutant linkages and ultimately deliver a site suitable for the proposed end-use. The report is subject to limitations which are set out in Appendix I.

2 SITE DESCRIPTION

The site is accessed from the west via Ashfield Road and is located approximately 1.5km north east of Finsbury Park. The site is level, triangular in shape and covers an area of approximately 0.06 hectare. Continuous rows of lock-up garages are present along the southwestern and western boundary with a block of two garages on the northern boundary. Ground surfacing's comprise a thin covering of tarmac chippings and grass. Several of the garages had what appeared to be asbestos containing roof panels. The remainder had felt roofs. All garages were locked and were generally in a good state of repair. Access was not possible into the garages themselves.

The site is surrounded in all compass directions by residential houses. Photographs of the site are included in Appendix G.

3 GEOLOGY, HYDROLOGY AND HYDROGEOLOGY

3.1 Geology

Reference to BGS online mapping indicates that the site is underlain by bedrock geology of the London Clay. The London Clay is underlain by the Lambeth Group and in turn by the Chalk. Superficial deposits are not denoted.

The Envirocheck Report (Appendix C) details the risk of geological hazard potential on or underlying the site and this is summarised in the following table:-

Table 1 Geological Hazards

Hazard	Risk
--------	------

Compressible ground	No Hazard
Landslide ground	Very Low
Running sand	Very Low
Collapsible rocks	Very Low
Shrinking/Swelling Clay	Moderate
Ground dissolution	No Hazard

A moderate risk of swelling clay has been identified which refers to the London Clay.

3.2 Hydrology

The nearest surface water feature is the 'New River' located 380m south of the site. No river quality data is available for this watercourse or for any watercourse within 1000m of the site. There are no licensed surface water abstractions within 250m of the site.

3.3 Hydrogeology

The London Clay is designated as 'unproductive' in terms of groundwater resources. The site is located within a groundwater Source Protection Zone 2. However this does not relate to water being abstracted from the London Clay but the chalk, at some considerable depth below the site.

4 SITE HISTORY

The history of the site and the surrounding area has been determined from historical map extracts. Copies of these extracts are included in Appendix B. The outline of the site shown is georeferenced to the current grid system; due to inaccuracies in mapping techniques the actual boundary on older maps may vary. Smaller scale (e.g. 1:10,000) maps were reviewed, but did not provide further relevant historical information. Given the size of these files sizes, smaller scale maps are not appended to the report but are available separately. The historical land uses on site and in close proximity to the site are summarised in the following sections.

4.1 On-Site History

The earliest historical map of 1863 denotes the site as part of a larger open field. By 1915 the site is surrounded by residential houses but the land itself remains open ground. The 1948 aerial photo appears to show a structure on the southern boundary and one in the centre although the resolution is poor. These structures aren't reproduced on subsequent mapping entries. The mapping indicates that by 1971, a row of garages were present along the southwestern boundary, and two are present on the northern and western boundaries.

The 1999 aerial image shows a similar layout to present day. Scrutiny of the Google Earth imagery from 2002 denotes no further changes or reconfigurations to the site.

4.2 Off-Site History

The earliest historical map of 1863 denotes the site as part of a larger open field. In 1871 a railway line has been constructed approximately 80m north of the site. The 1896 map denotes a 'Fever Hospital' located immediately north of the Railway Line as well as a Brick Works approximately 200m southeast of the site. By 1915 the Brick Works is no longer denoted. The footprint is covered in housing and factories.

By 1915, Ashfield Road is denoted and terraced residential housing is denoted to the south and west of the site. By 1936 the site is surrounded by residential housing in all compass directions. A Furniture Works and a Piano and Joinery Works are denoted between 50m – 100m west of the site. By 1986 these Works are denoted as an industrial estate. There are no further changes.

5 INFORMATION HELD BY STATUTORY AUTHORITIES

This section details any relevant information held in the registers maintained by statutory bodies as identified in the Groundsure Report in Appendix C.

5.1 Waste Management Facilities

The Envirocheck Report identifies no landfill sites or waste management facilities within 1000m of the site. There is one infilled land entry within 250m of the site described as ‘Unknown Filled Ground (Pit, quarry etc)’, 197m southeast of the site. This relates to the Brick Works as discussed in Section 4.2.

5.2 Pollution Prevention and Control Permits

There are ten active and inactive Local Authority Pollution & Prevention Controls within 1000m of the site. The nearest is located 388m north of the site and relates to ‘PG1/14 Petrol filling station’.

5.3 Contemporary Trade Directories

There are 345No. active and inactive directories within 1000m of the site. The closest is described as a machine shop at an Art Makers, 82m northwest of the site. The nearest inactive entry is noted as a Carpet, Curtain & Upholstery Cleaners, 22m southeast of the site.

5.4 Pollution Incidents to Controlled Waters

Records held by the Environment Agency identify no pollution incidents within 1000m of the site.

5.5 Discharge Consents

The Envirocheck Report identifies no discharge consents within 500m of the site.

5.6 Radon

The Envirocheck Report states that the property is not within a Radon Affected Area and that no radon protection measures are required.

6 UK CONTAMINATED LAND LEGISLATIVE FRAMEWORK

6.1 Legislation on Contaminated Land

Part IIA of the Environmental Protection Act, 1990, enacted by Section 57 of the Environment Act 1995 and the associated Contaminated Land (England) Regulations 2000 (SI 2000/227) was introduced on 1 April 2000.

Part IIA provides a statutory definition of contaminated land:

“any land which appears to the Local Authority in whose area it is situated to be in such a condition by reason of substances in, on or under the land, that significant harm is being

caused, or that there is a significant possibility of significant harm being caused, or that pollution of controlled waters is being or is likely to be caused”.

Controlled waters are considered to be all groundwaters, inland surface waters and estuarine and coastal waters.

To determine whether land falls under the Part IIA definition of contaminated land the site should be evaluated in the context of a risk based framework. The assessment of contaminated land is typically a two-phase process which is initially based on a qualitative assessment of the likelihood of complete pollution linkages, with a quantitative element which seeks to determine the degree and the significance of the harm. Land is only defined as ‘Contaminated Land’ if a “significant pollutant linkage” is present.

A pollutant linkage must comprise of the following:-

Source - a contaminant or substance which is located in, on or under the land and has potential to cause harm to human health, water resources or the wider environment.

Pathway - the means or route by which a source can migrate;

Receptor - something which could come to harm, including human health, water resources, surface water courses or the wider environment.

The responsible authority then needs to consider whether the identified pollution linkage:

- is resulting in significant harm being caused to the receptor in the pollutant linkage;
- presents a significant possibility of significant harm being caused to that receptor;
- is resulting in the pollution of controlled waters, which constitute the receptor; or is likely to result in such pollution.

If a pollutant linkage is demonstrated, then the Part IIA legislation provides powers for remedial action to be enforced by the Local Authority in whose area the contaminated land is situated.

7 CONCEPTUAL MODEL

7.1 General

This section uses information from the site walkover and historical maps to provide a conceptual model and qualitative assessment of the potential risks posed to human health and environmental receptors from potential on-site and off-site sources of contamination. The assessment is presented as a ‘source-pathway-receptor’ model in accordance with Part IIA of the Environmental Protection Act 1990.

The conceptual model has been developed assuming that the site will be redeveloped for a residential end use with private gardens.

7.2 Potential Sources of Contamination

Potential On-site Sources of Contamination

- The site has historically been occupied by Garages which are a source of hydrocarbons and metals.
- Storage and repair of motor vehicles is considered a potential source of metal, hydrocarbon and waste oil contamination and ground vapours from spilled fuels and oils.
- Drainage runs are considered potential sources of hydrocarbon contamination. In the authors experience, soakaways can also be potential sources of hydrocarbons and waste oils on lock up garage sites. However there is a low likelihood of soakaways due to the underlying soil being clay.

Potential Off-Site Sources of Contamination

- Off-site sources of contamination are not considered to be present. There is one infilled land entry within 250m of the site described as '*Unknown Filled Ground (Pit, quarry etc)*', 197m southeast of the site. This relates to a former Brick Works which according to historical mapping was very short lived, denoted as present between 1896 and 1915. This is not considered to be a source of land-borne gas due to its age, its' distance from site and the low permeability geological strata that underlies the area.

7.3 Receptors

The site rests upon an unproductive aquifer and the nearest controlled surface water is located 380m distant. Thus controlled waters are not considered to be receptors to site derived contamination.

When considering the risk to future occupants, it must be borne in mind that the residences will be constructed within a single, triangular shaped basement area extending to approximately 3m below existing ground level. Any future gardens will be at 3.00m begl and thus it is highly unlikely that contamination would have migrated to this depth in London Clay. Based upon the historical maps, it is also considered unlikely that human intervention could have disturbed ground to 3.00m depth. However for completeness, and in lieu of the ground investigation data, the primary receptors are considered to be:-

Human Health

- Construction workers during the redevelopment phase.
- Residential end users.

7.4 Pathways

Potential contaminant migration pathways considered relevant to the site are:-

Human Health

- Ingestion of contaminated soils and dust particles.
- Direct physical contact with near surface soils and contaminated dust particles.
- Inhalation of wind blown contaminated dust.
- Inhalation of hydrocarbon vapours migrating vertically into the atmosphere.

- Inhalation of hydrocarbon vapours, migrating vertically into buildings and confined spaces.

Infrastructure

- Water supply pipework.

8 FIELDWORK

The intrusive fieldwork was carried out on 11th May 2021 and comprised 1No. cable percussion borehole, 3No. dynamic sampling boreholes and 2No. hand-excavated pits.

The site work was undertaken under the instruction and supervision of The Brownfield Consultancy, with the ground investigation procedures and sample descriptions based on BS 5930 (2015) 'Code of Practice for Site Investigations' and BS 10175 (2011) "Investigation of potentially contaminated sites - code of practice". The locations of the exploratory holes are shown on the Drawing included in Appendix A. The exploratory hole records are presented in Appendix D.

8.1 Cable Percussion Boreholes

The cable percussion borehole, BH01, was advanced to 15.50m depth using light cable tool percussion boring techniques. Standard Penetration Tests (SPTs) were undertaken in accordance with BS EN ISO 22476-3:2005+A1:2011 at 1.0m intervals and small disturbed samples (D) were obtained at the test points.

8.2 Dynamic Sampler Boreholes

The dynamic sampler boreholes, WS1 to WS3, were each drilled to 5.45m depth. The windowless sampling technique uses a lightweight tracked rig to advance a borehole by 1m intervals using 1m long steel sampler tubes, containing plastic liners into which the substrata deposits are driven, at diameters of 100mm reducing to 70mm. The soils are then recovered from each sampler tube as continuous core samples, which are then logged and sub-sampled on site. Standard Penetration Tests (SPTs) were undertaken in accordance with BS EN ISO 22476-3:2005+A1:2011 at 1.0m intervals and hand shear vane testing was also carried out in order to provide soil strength parameters for geotechnical design.

A standpipe was installed in WS2 to enable groundwater and land-borne gas monitoring. The response zone was from 1.00m to 5.00m depth.

8.3 Hand-excavated Pits

Two pits were excavated by hand to 0.90m bgl in order to retrieve soil samples for contamination testing and determine the depth to the construction formation.

For details of the depth of each exploratory hole, strata encountered, samples taken, information on groundwater encountered, results of any in-situ testing and any other relevant information, reference should be made to the logs presented in Appendix D.

8.4 Monitoring

One gas and groundwater level monitoring visit was undertaken on 20th May 2021. Gas monitoring involved the measurement of methane (CH₄), carbon dioxide (CO₂) and oxygen

(O₂) together with atmospheric pressure, downhole pressure and flow rates using a calibrated Geotech GA 2000 gas analyser. Following ground gas measurements the boreholes were dipped to the water table and the base of each borehole. An interface probe was used to detect the presence of LNAPL / DNAPL. The monitoring records are included in Appendix H.

9 LABORATORY TESTING

9.1 Geotechnical and Geochemical

A programme of laboratory testing was scheduled to determine the geotechnical properties of selected soil samples obtained from the investigation. The details of the geotechnical testing are summarised in the following table:-

Summary of Geotechnical and Geochemical Laboratory Testing Suites

Water soluble sulphate and pH: BRE SD1 Suite B	6
Atterberg Limits with moisture content	7

Tests were carried out in accordance with BS1377 (1990) "Methods of test for Soils for Civil Engineering purposes" and Building Research Establishment Special Digest 1 "Concrete in Aggressive Ground". The results of the geotechnical testing are presented in Appendix E.

9.2 Soils - Chemical

A programme of chemical laboratory testing was scheduled on 13No. soil samples taken from various depths in the Made Ground recovered from the boreholes and hand pits. Where hydrocarbon contamination was suspected, corresponding samples would be submitted for TPHCWG. Otherwise, across general locations, TPH Total or TPH Texas Banded were scheduled, as a basic screening tool. The samples were placed into suitable containers for the required chemical analysis.

All samples were transported to I2 in Watford which is accredited under UKAS and MCerts. The following table summarises the contaminants scheduled:-

Summary of Soil Chemical Laboratory Testing Suites

Determinant	No
CLEA Metals	11
Speciated Polycyclic Aromatic Hydrocarbons (PAH)	8
Asbestos screen	7
TPHCWG	1
BTEX	1
TPH Total	7
Waste Acceptance Criteria	1

The results of the laboratory chemical testing are interpreted in Section 13 and presented in full in Appendix F.

10 GROUND AND GROUNDWATER CONDITIONS

10.1 Strata Encountered

The exploratory holes confirmed the published geology, finding London Clay beneath minor deposits of Made Ground. A summary of the strata encountered during the investigation is described in the following sections, but for full details and descriptions, reference should be made to the exploratory hole records presented in Appendix D.

10.2 Made Ground

Made Ground was encountered to depths of 0.30m to 1.00m and consisted of upper layers of mainly black ashy sand and/or gravel with variable inclusions of flint, concrete, brick, ceramic tile, pottery, clinker and slate. Cobbles were frequent and comprised red brick. Rare glass was also recorded.

Beneath these deposits, soft clay was found with similar inclusions of extraneous materials.

10.3 London Clay

The London Clay consisted of soft, becoming firm, then stiff clay. The clay became fissured with depth and zones of the clay were silty and/or fine-sandy and included small clusters or patches of fine claystone gravel or silt or fine sand. Clusters of selenite crystals were also found.

The un-weathered (grey) zone of the London Clay was encountered at 7.50m in the deeper BH01 and consisted of stiff, fissured grey, silty clay to the base of the borehole at 15.50m bgl.

10.4 Groundwater

Groundwater was not observed in BH01 or WS3 but was encountered at 5.30m in WS1 and as a perched pocket at 1.00m in WS2.

Monitoring of the standpipe installed in WS2 on the single occasion to date, revealed groundwater standing at 0.40m. However, this is considered to be attributable to run off from the aforementioned perched pocket into the standpipe from which there is no drainage path due to the relatively impermeable clay surround.

10.5 Contamination

Made Ground frequently contained ash and clinker which can contain elevated levels of metals and polycyclic aromatic hydrocarbons. A layer of dark grey mottled black slightly gravelly clay was encountered in WS2 (0.55-0.90m) and this was subsequently scheduled for TPHCWG and BTEX determinants.

11 HUMAN HEALTH QUANTITATIVE RISK ASSESSMENT

Qualitative assessment of risks may be sufficient in many cases to eliminate the possibility of significant pollutant linkages. However, quantitative risk assessment is formally required to determine whether there is a 'significant possibility of significant harm being caused'. Part IIA of the Environmental Protection Act 1990 recommends that 'authoritative and scientifically based guideline values for concentrations of the potential pollutants in or under the land' be used to quantify the risk posed by contamination.

Under the Planning Regime a quantitative risk assessment can be used to decide whether the site is suitable for the proposed use. In addition, the National Planning Policy Framework (March 2012) also indicates that after remediation as a minimum land should not be capable of being determined as contaminated land under Part IIA.

11.1 Current UK Screening Values

The UK technical guidance for assessing risks to human health is issued from various UK bodies including the Environment Agency (EA), the DEFRA, Contaminated Land: Applications in Real Environment (CL:AIRE), Chartered Institute of Environmental Health (CIEH) and Land Quality Management (LQM) Ltd (part of the University of Nottingham).

New and updated screening values in the form of provisional Category four Screening Levels (C4SL) (published in 2014) and Suitable for Use Levels (S4UL) (published 2015) have been produced by defra and CIEH / LQM respectively using modified versions of the EA's Contaminated Land Exposure Assessment (CLEA) software.

11.2 Current UK Screening Values

The UK technical guidance for assessing risks to human health is issued from various UK bodies. New and updated screening values in the form of provisional Category four Screening Levels (C4SL) (published in 2014) and Suitable for Use Levels (S4UL) (published 2015) have been produced by DEFRA and CIEH / LQM respectively using the EA's Contaminated Land Exposure Assessment (CLEA) software.

11.3 C4SL

Provisional C4SL have been derived by CL:AIRE following guidance and as a tool to assist in applying the Part IIA Category 1- 4 classifications to a site. The purpose of the C4SL is to provide a simple test for deciding that land is suitable for use and 'definitely not' contaminated land under Part IIA. They describe a level of risk that is above minimal but is still low.

Six contaminants have been assigned provisional C4SL: arsenic; benzene; benzo[a]pyrene; cadmium; chromium VI and lead for the standard land uses (residential with and without plant uptake, allotments, commercial and public open space (parks and residential)).

The C4SL are also considered suitable to be used under the planning regime.

11.4 S4UL

The LQM / CIEH S4UL represent generic assessment criteria based on minimal or tolerable risk that are intended to be protective of human health. They represent values above which further assessment of the risks or remedial actions may be needed.

S4UL have been derived for a comprehensive list of organic and inorganic determinants.

11.5 Soil Chemistry

When considering the risk to future occupants, it must be borne in mind that the residences will be constructed within a single, triangular shaped basement area extending to approximately 3m below existing ground level. The lower floor will be at basement level, approximately 3m below existing ground level. Thus any future gardens will be at 3.00m bgl. Thus a comparison with the S4UL and C4SL is largely irrelevant.

The ground investigation has confirmed that the maximum depth of Made Ground is 1.00m and thus any future garden areas will rest directly on uncontaminated London Clay at 3.00m. Additionally, there was no visual and olfactory evidence of hydrocarbon contamination and thus a risk to future occupants via the (hydrocarbon/VOC) '*vapour inhalation*' pathway is not present.

There does however remain a risk to construction workers. There are no formal guideline values published by authoritative bodies on the risk to construction workers and hence we have simply summarised the findings in the following sections:-

11.6 Metals

Most notably, a maximum concentration of arsenic of 43mg/kg and zinc of 8900mg/kg was recorded in BH01 at 0.20m. Lead concentrations greater than 1000mg/kg were recorded in WS2 at 0.10m (1000mg/kg), WS3 at 0.45m (5800mg/kg) HP1 at 0.20m (1800mg/kg). The concentrations are considered attributable to ash and/or clinker.

11.7 Hydrocarbons

Seven samples of Made Ground were submitted to total petroleum hydrocarbons (TPH) and a maximum concentration of 230mg/kg was recorded. A layer of dark grey mottled black slightly gravelly clay was encountered in WS2 (0.55-0.90m) and this was subsequently scheduled for TPHCWG and BTEX determinants. Concentrations were recorded at less than the laboratory limit of detection.

None of the identified hydrocarbons are considered to present a vapour risk to future occupants.

11.8 Polycyclic Aromatic Hydrocarbons (PAH)

Concentrations of PAH were insignificant in Made Ground with a maximum concentration of 42mg/kg in WS3 at 0.45m. The concentrations are considered attributable to ash and/or clinker.

11.9 Asbestos

Seven samples of Made Ground were scheduled for an asbestos screen and asbestos was not recorded.

11.10 Risks to Construction Workers

Gross organic and inorganic contamination has not been recorded at the site. Thus, provided that construction workers are provided with adequate PPE, then risks will be mitigated. This is discussed further in Section 14.

12 GEOTECHNICAL ENGINEERING ASSESSMENT

12.1 Proposed Development

It is understood that it is proposed to construct three two-storey residences within a single, triangular shaped basement area extending to approximately 3m below existing ground level. The lower floor will be at basement level, approximately 3m below existing ground level.

12.2 Summary of Ground Conditions

The site is underlain by Made Ground over London Clay. Made Ground was encountered to depths of 0.30m to 1.00m and consisted of upper layers of sand and flint gravels over beds of soft sandy gravelly clays. All layers had variable inclusions of ash, concrete, brick, ceramic tile, clinker and slate.

The London Clay was soft, becoming firm between 1.5m and 2.0m, then stiff between 2.5m and 3.5m. The clay became fissured with depth and zones of the clay were silty and/or fine-sandy and included small clusters or patches of fine claystone gravel or silt or fine sand. Clusters of selenite crystals were also found.

The unweathered (grey) zone of the London Clay was encountered at 7.50m in the deeper BH01 and consisted of stiff, fissured grey, silty clay to the base of the borehole at 15.50m bgl.

Groundwater was not observed in BH01 or WS3 but was encountered at 5.30m in WS1 and as a perched pocket at 1.00m in WS2. Water was standing at 0.40m depth in the standpipe on a subsequent site visit. From these observations it is difficult to ascertain the actual phreatic surface level, but it is considered that the shallow standpipe reading is an anomaly and is due to a pocket of perched water collecting in the standpipe. For the circa 3m deep basement excavation it is considered unlikely that groundwater will be encountered other than run-off from the upper surface of the clay and possibly very limited inflows from water trapped in small clusters of granular material within the clay mass.

12.3 Foundations and Floor Slab

It is understood that the preferred foundation option is a basement raft construction supporting the building wall loads and internal columns. From the ground investigation findings, it is considered that this is a viable option. Although the gain in strength with depth of the London Clay found here is not as great as is typical of the formation in this general area, it is anticipated that the *net* loads at basement floor level will be relatively small, possibly negative away from the load-bearing walls and columns. For design purposes, it is recommended that a net allowable bearing pressure of 50kN/m² is assumed for the raft in general, increasing to 100kN/m² beneath line and 'point' loads up to 0.75m wide.

Although the basement is relatively shallow, there will, nevertheless, be a degree of long-term upward pressure due to stress relief following removal of the overburden. The actual upward pressure is extremely difficult to predict as there are a number of unknown factors that affect it, such as the stress history of the clay and, therefore, the degree of over-consolidation, and the long-term future exposure of the clay at formation level to ground-borne water. Laboratory testing and analyses to assist in predicting the heave pressures are currently undergoing changes towards far more sophisticated techniques than 'traditional' methods, which have frequently been found to be unreliable, but the costs of such would not be warranted on a project of this size. Therefore, it is recommended that future heave pressures of up to 30kN/m² should be assumed and incorporated into the design of the basement raft. However, this assumes that the formation is protected against wet weather and, particularly, the accumulation of water on the surface, as this could lead to heave pressures far exceeding those attributable to stress relief alone.

12.4 London Clay - Geotechnical Parameters

It is understood that an estimate of the Modulus of Elasticity (E) of the London Clay is required for analyses. In the absence of specific testing, it is recommended that a widely published 'rule of thumb' for London Clay is assumed which states:

$$E = 450 \cdot c_u$$

where c_u is the undrained cohesive strength of the London Clay.

Assuming the basement floor formation level is the 'depth of interest', the cohesive strength of the London Clay at that level, measured by the hand shear vane and, indirectly, the SPT, is in the range 55kN/m² to 110kN/m².

For determination of the earth pressure on the pile basement wall, the following parameters are recommended for the London Clay:

Coefficient of active earth pressure, $K_a = 0.472$

Coefficient of passive earth pressure, $K_p = 2.119$

Coefficient of earth pressure at rest, $K_0 = 1.00$

Unit weight = 19.5kN/m³

However, attention is drawn to the following section.

12.5 Soil Volume Change

It is noted that there are a number of trees located on the site boundary and laboratory testing has indicated the London Clay to be of *high* volume-change potential. Consideration should be given, therefore, to possible lateral heave pressures on the pile basement wall should any trees be felled, die or be significantly lopped which would result in rehydration of the clay and an increase in volume. It may be necessary/prudent to install a compressible layer or void former against the wall to accommodate heave.

12.6 Chemical Considerations for Buried Concrete

The results of testing on six soil samples in accordance with BRE SD1 (2005) "Concrete in aggressive ground" Suite B, has indicated water-soluble sulphate concentrations (SO₄ in 2:1 soil aqueous extract) of 531mg/kg to 4010mg/kg and pH values of 7.2 to 9.0. Calculation of the oxidisable sulphides (OS) from the total sulphate and total sulphur results using the method of the digest indicates an extremely high level of pyrite in the soil and, therefore, very high level of total potential sulphate (TPS), ranging from 1.4% to 6.3% with four of the six results in excess of the highest classification threshold of 2.4%.

It is considered that the groundwater regime can be regarded as *static* which, together with the results relating to the soluble sulphate test, place the site in Design Sulphate Class **DS-4** and Aggressive Chemical Environment for Concrete (ACEC) class **AC-3s**. However, where the soil is to be disturbed and exposed to air, potentially oxidising the pyrite, the classifications **DS-5** and **AC-4s** should be assumed.

13 GAS PROTECTION REQUIREMENTS

13.1 Ground Gas

The Desk Top Study and preliminary conceptual model identified no sources of land-borne gas. There is one infilled land entry within 250m of the site described as '*Unknown Filled Ground (Pit, quarry etc)*', 197m southeast of the site. This relates to a former Brick Works which, according to historical mapping, was very short lived, denoted as present between 1896 and 1915. This is not considered to be a source of land-borne gas due to its age, its distance from site and low permeability geological strata that underlies the area.

Notwithstanding this, a return visit to site was made was undertaken on 20th May 2021 and gas readings recorded in location WS2.

The current guidance on protecting buildings from ground gas hazards is contained in the document: CIRIA C665 with updated risk assessment guidance contained within BS8485 (2015). It is intended that the proposed new build will be residential apartments, a 'Type B' Building.

The level of gas protection is determined by comparing the following parameters to cut-off values prescribed within BS8485 (2015):

- "Typical Maximum Concentrations" for initial screening purposes.
- Risk based "Gas Screening Values" (GSV) for consideration where the typical maximum concentrations are exceeded.

The GSV is calculated using the following equation and the resulting GSV are compared to the Site Characteristic GSV given in Table 2 of BS8485 (2015).

Maximum gas concentration (%) x worst case borehole flow rate (l/h)

Methane was not recorded. A maximum carbon dioxide concentration of 0.2% vol. together with a maximum flow rate of 2.7l/hr was recorded. The flow rate quickly diminished and remained steady at 0.4l/hr. We consider that the flow rate is attributable to shallow groundwater recorded in the standpipe (0.40m bgl). The calculated GSV for carbon dioxide is 0.0054l/hr.

Referring to Table 2 of BS8485 (2015), the site can be categorised as a Characteristic Situation 1 (CS1). Gas protection measures are not required. The gas monitoring records are presented in Appendix H.

14 CONCLUSIONS AND RECOMMENDATIONS

14.1 Land Contamination

The residences will be constructed within a single, triangular shaped basement area extending to approximately 3m below existing ground level. The lower floor will be at basement level, approximately 3m below existing ground level. Future gardens (if proposed) will rest directly upon uncontaminated London Clay and thus remediation is not a requirement. Vapour risks to future occupants have not been identified.

Contamination hotspots may be encountered as groundworks progress, particularly below the lock-up garages. It is the responsibility of the Site Manager to inform the Brownfield Consultancy should unexpected contamination be observed. The Brownfield Consultancy will assess each occurrence on its merit and, if considered necessary, will visit site to determine the most appropriate course of action in consultation with the Local Planning Authority.

14.2 Risks to Construction Workers

A risk to construction workers has been identified from elevated concentrations of metals and semi-volatile organics in Made Ground. All site works should be undertaken in accordance with the guidelines prepared by the Health and Safety Executive. During the redevelopment, precautions should be taken to minimise exposure of workers and the general public to potentially harmful substances.

Precautions should include, but not be limited to:

- Personal hygiene, washing and changing procedures;
- Adequate PPE including disposable overalls, gloves and particulate filter masks/vapour respirators, where required;
- Safe storage of fuel and other potentially polluting liquids and the provision of spill control and clean up facilities;

14.3 Gas Protection Measures

Ground gas protection measures are not required. Radon protection measures are not required.

14.4 Buried Services

Underground water supply pipework can be affected by contaminated soils or aggressive materials within the ground. Plastic based water pipes in particular are vulnerable to attack by free phase (liquid) hydrocarbons. Assuming that the water supply infrastructure is installed along the existing access road at 0.90m bgl, and based upon the maximum depth of Made Ground recorded in exploratory holes HP1 and HP2 of 0.50m, then the pipework will rest entirely in uncontaminated London Clay. It must also be borne in mind that none of the organic contaminants recorded in Made Ground are attributable to free phase hydrocarbons, but rather simply bound within the ash and clinker. Thus there is no requirement for upgraded water supply pipework at this site. Consultation with the Local Water Authority is recommended.

14.5 Geotechnical

The reader is referred to Section 12 where the geotechnical conclusions are presented in full.

Published 1863 - 1864

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Historical Aerial Photography

Published 1946 - 1949

Source map scale - 1:1,250

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Ordnance Survey Plan

Published 1954 - 1955

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1973 - 1977

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1991

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

LANDMARK INFORMATION GROUP[®]

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Envirocheck[®]

LANDMARK INFORMATION GROUP[®]

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

LANDMARK INFORMATION GROUP[®]

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Standard Geotechnical, Asbestos and Chemical Testing Laboratory located at: ul. Pionierów 39, 41 -711 Ruda Śląska, Poland.

Accredited tests are defined within the report, opinions and interpretations expressed herein are outside the scope of accreditation.

Standard sample disposal times, unless otherwise agreed with the laboratory, are :

soils - 4 weeks from reporting
leachates - 2 weeks from reporting
waters - 2 weeks from reporting
asbestos - 6 months from reporting

Excel copies of reports are only valid when accompanied by this PDF certificate.

Any assessments of compliance with specifications are based on actual analytical results with no contribution from uncertainty of measurement.
Application of uncertainty of measurement would provide a range within which the true result lies.
An estimate of measurement uncertainty can be provided on request.

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Moisture Content	Moisture content, determined gravimetrically. (30 oC)	In house method.	L019-UK/PL	W	NONE
pH in soil (automated)	Determination of pH in soil by addition of water followed by automated electrometric measurement.	In house method.	L099-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
Total Sulphate in soil as %	Determination of total sulphate in soil by extraction with 10% HCl followed by ICP-OES.	In house method.	L038-PL	D	MCERTS
Total Sulphur in soil as %	Determination of total sulphur in soil by extraction with aqua-regia, potassium bromide/bromate followed by ICP-OES.	In house method.	L038-PL	D	MCERTS
Sulphate, water soluble, in soil (16hr extraction)	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In house method.	L038-PL	D	MCERTS
Sulphate, water soluble, in soil	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In house method.	L038-PL	D	MCERTS

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.

For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.

Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30oC.

Unless otherwise indicated, site information, order number, project number, sampling date, time, sample reference and depth are provided by the client. The instructed on date indicates the date on which this information was provided to the laboratory.

Project / Site name: 10-16 Ashfield Road

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Sulphate, water soluble, in soil (16hr extraction)	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In house method.	L038-PL	D	MCERTS
Metals in soil by ICP-OES	Determination of metals in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Asbestos identification in soil	Asbestos Identification with the use of polarised light microscopy in conjunction with disperion staining techniques.	In house method based on HSG 248	A001-PL	D	ISO 17025
Boron, water soluble, in soil	Determination of water soluble boron in soil by hot water extract followed by ICP-OES.	In-house method based on Second Site Properties version 3	L038-PL	D	MCERTS
Hexavalent chromium in soil	Determination of hexavalent chromium in soil by extraction in water then by acidification, addition of 1,5 diphenylcarbazide followed by colorimetry.	In-house method	L080-PL	W	MCERTS
Moisture Content	Moisture content, determined gravimetrically. (30 oC)	In house method.	L019-UK/PL	W	NONE
Speciated EPA-16 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270	L064-PL	D	MCERTS
pH in soil (automated)	Determination of pH in soil by addition of water followed by automated electrometric measurement.	In house method.	L099-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
BTEX and MTBE in soil (Monoaromatics)	Determination of BTEX in soil by headspace GC-MS.	In-house method based on USEPA8260	L073B-PL	W	MCERTS
Cr (III) in soil	In-house method by calculation from total Cr and Cr VI.	In-house method by calculation	L080-PL	W	NONE
TPHCWG (Soil)	Determination of hexane extractable hydrocarbons in soil by GC-MS/GC-FID.	In-house method with silica gel split/clean up.	L088/76-PL	W	MCERTS
TPH Banding in Soil by FID	Determination of hexane extractable hydrocarbons in soil by GC-FID.	In-house method, TPH with carbon banding and silica gel split/cleanup.	L076-PL	W	MCERTS
Total Sulphate in soil as %	Determination of total sulphate in soil by extraction with 10% HCl followed by ICP-OES.	In house method.	L038-PL	D	MCERTS
Total Sulphur in soil as %	Determination of total sulphur in soil by extraction with aqua-regia, potassium bromide/bromate followed by ICP-OES.	In house method.	L038-PL	D	MCERTS
Sulphate, water soluble, in soil	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In house method.	L038-PL	D	MCERTS

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.

For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.

Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30oC.

Unless otherwise indicated, site information, order number, project number, sampling date, time, sample reference and depth are provided by the client. The instructed on date indicates the date on which this information was provided to the laboratory.

Standard Geotechnical, Asbestos and Chemical Testing Laboratory located at: ul. Pionierów 39, 41 -711 Ruda Śląska, Poland.

Accredited tests are defined within the report, opinions and interpretations expressed herein are outside the scope of accreditation.

Standard sample disposal times, unless otherwise agreed with the laboratory, are :

soils	- 4 weeks from reporting
leachates	- 2 weeks from reporting
waters	- 2 weeks from reporting
asbestos	- 6 months from reporting

Excel copies of reports are only valid when accompanied by this PDF certificate.

Any assessments of compliance with specifications are based on actual analytical results with no contribution from uncertainty of measurement. Application of uncertainty of measurement would provide a range within which the true result lies. An estimate of measurement uncertainty can be provided on request.

Landfill WAC analysis (specifically leaching test results) must not be used for hazardous waste classification purposes as defined by the Waste (England and Wales) Regulations 2011 (as amended) and EA Guidance WM3. This analysis is only applicable for landfill acceptance criteria (The Environmental Permitting (England and Wales) Regulations) and does not give any indication as to whether a waste may be hazardous or non-hazardous.

Acid neutralisation capacity of soil	Determination of acid neutralisation capacity by addition of acid or alkali followed by electronic probe.	In-house method based on Guidance an Sampling and Testing of Wastes to Meet Landfill Waste Acceptance"	L046-PL	W	NONE
Loss on ignition of soil @ 450oC	Determination of loss on ignition in soil by gravimetrically with the sample being ignited in a muffle furnace.	In house method.	L047-PL	D	MCERTS
Mineral Oil (Soil) C10 - C40	Determination of mineral oil fraction extractable hydrocarbons in soil by GC-MS/GC-FID.	In-house method with silica gel split/clean up.	L076-PL	D	NONE
Moisture Content	Moisture content, determined gravimetrically. (30 oC)	In house method.	L019-UK/PL	W	NONE
Speciated WAC-17 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270. MCERTS accredited except Coronene.	L064-PL	D	NONE
PCB's By GC-MS in soil	Determination of PCB by extraction with acetone and hexane followed by GC-MS.	In-house method based on USEPA 8082	L027-PL	D	MCERTS
pH at 20oC in soil	Determination of pH in soil by addition of water followed by electrometric measurement.	In house method.	L005-PL	W	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
Total organic carbon (Automated) in soil	Determination of organic matter in soil by oxidising with potassium dichromate followed by titration with iron (II) sulphate.	In house method.	L009-PL	D	MCERTS
BTEX in soil (Monoaromatics)	Determination of BTEX in soil by headspace GC-MS.	In-house method based on USEPA8260	L073B-PL	W	MCERTS
Total BTEX in soil (Poland)	Determination of BTEX in soil by headspace GC-MS.	In-house method based on USEPA8260	L073-PL	W	MCERTS
Metals in leachate by ICP-OES	Determination of metals in leachate by acidification followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil"	L039-PL	W	ISO 17025
Chloride 10:1 WAC	Determination of Chloride colorimetrically by discrete analyser.	In house based on MEWAM Method ISBN 0117516260.	L082-PL	W	ISO 17025
Fluoride 10:1 WAC	Determination of fluoride in leachate by 1:1ratio with a buffer solution followed by Ion Selective Electrode.	In-house method based on Use of Total Ionic Strength Adjustment Buffer for Electrode Determination"	L033B-PL	W	ISO 17025
Sulphate 10:1 WAC	Determination of sulphate in leachate by ICP-OES	In-house method based on MEWAM 1986 Methods for the Determination of Metals in Soil"	L039-PL	W	ISO 17025
Total dissolved solids 10:1 WAC	Determination of total dissolved solids in water by EC probe using a factor of 0.6.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton	L004-PL	W	ISO 17025

Analytical Report Number : 21-74381

Project / Site name: 10-16 Ashfield Road

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Monohydric phenols 10:1 WAC	Determination of phenols in leachate by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton	L080-PL	W	ISO 17025
Dissolved organic carbon 10:1 WAC	Determination of dissolved inorganic carbon in leachate by TOC/DOC NDIR Analyser.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton	L037-PL	W	NONE

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.

For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.

Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30°C.

Unless otherwise indicated, site information, order number, project number, sampling date, time, sample reference and depth are provided by the client. The instructed on date indicates the date on which this information was provided to the laboratory.

APPENDIX I

Limitations

NOTES ON LIMITATIONS

This report has been prepared by the Brownfield Consultancy with all reasonable skill, care and diligence. This report is confidential and has been prepared solely for the benefit of the client as stated at the front of the report in relation to a specific development or scheme; and those parties with whom a warranty agreement has been executed, or with whom an assignment has been agreed.

Should any third party wish to use or rely upon the contents of the report, written approval must be sought from The Brownfield Consultancy; a charge may be levied against such approval. We accept no responsibility or liability for the consequences of this document being used for any purpose or project other than for which it was commissioned, and: this document to any third party with whom an agreement has not been executed.

Any comments given are based on the understanding that the proposed development will be as detailed. The Brownfield Consultancy warrants the accuracy of this report up to and including the published date. Additional information, improved practice or changes in legislation may necessitate this report having to be reviewed in whole or in part after that date.

This report is only valid when used in its entirety. Any information or advice included in the report should not be relied upon until considered in the context of the whole report. Whilst this report and the opinion made herein are correct to the best of our belief we cannot guarantee the accuracy or completeness of any information provided by third parties.

The opinions and recommendations expressed in this report are based on statute, guidance, and appropriate practice current at the date of its preparation. The Brownfield Consultancy does not accept any liability whatsoever for the consequences of any future legislative changes or the release of subsequent guidance documentation, etc. Such changes may render some of the opinions and advice in this report inappropriate or incorrect and we will be pleased to advise if any report requires revision due to changing circumstances. Following delivery of a report we have no obligation to advise the Client or any other party of such changes or their repercussions.

Phase 1 Reports

The work undertaken to provide the basis of a Phase I report comprised a study of available documented information from a variety of sources, together with (where appropriate) a brief walk over inspection of the site. The opinions given in this report have been dictated by the finite data on which they are based and are relevant only to the purpose for which the report was commissioned. The information reviewed should not be considered exhaustive and has been accepted in good faith as providing true and representative data pertaining to site conditions. It should be noted that any risks identified in this report are perceived risks based on the information reviewed; actual risks can only be assessed following a physical investigation of the site.

Historical maps and aerial photographs provide a “snap shot” in time about conditions or activities at the site and cannot be relied upon as indicators of any events or activities that may have taken place at other times. Any borehole data from the British Geological Survey sources are included on the following basis: “The British Geological Survey accept no responsibility for omissions or misinterpretation of the data from their Data Bank as this may be old or obtained from non-BGS sources and may not represent current interpretation”.

Phase II Intrusive Investigations

The investigation of the site has been carried out to provide sufficient information concerning the type and degree of contamination, and ground and groundwater conditions to allow a reasonable risk assessment to be made. The conclusions and recommendations made in this site appraisal report and the opinions expressed are based on the information reviewed and/or the ground conditions encountered in exploratory holes and the results of any field or laboratory testing undertaken. There may be ground conditions at the site that have not been disclosed by the information reviewed or by the investigative work undertaken. Such undisclosed conditions cannot be taken into account in any analysis and reporting.

Some of the conclusions in this site appraisal report may be based on third party data. No guarantee can be given for the accuracy or completeness of any of the third party data used.

The evaluation and conclusions do not preclude the existence of contamination, which could not reasonably have been revealed by the current work. Given the discrete nature of sampling, no investigation technique is capable of identifying all conditions present in all areas. The number of sampling points and the methods of sampling and testing do not preclude the existence of localised “hotspots” of contamination or different ground conditions where concentrations may be significantly higher than those actually encountered. Hence this report should be used for information purposes only and should not be construed as a comprehensive characterisation of all site conditions.

It should be noted that groundwater levels, groundwater chemistry, surface water levels, surface water chemistry, soil gas concentrations and soil gas flow rates can vary due to seasonal, climatic, tidal and man-made effects.

Exploratory hole locations provided in the report are generally established by tape measurement from existing features or boundaries. Hole locations are not accurately surveyed and ground levels at these locations are not obtained unless specifically requested.

The interpretation carried out in this report is based on scientific and engineering appraisal carried out by suitably experienced and qualified technical consultants based on the scope of our engagement. We have not taken into account the perceptions of, for example, banks, insurers, other funders, lay people, etc., unless the report has been prepared specifically for that purpose. Advice from other specialists may be required such as the legal, planning and architecture professions, whether specifically recommended in our report or not.

The objectives of the investigation have been linked to establishing the risks associated with potential human targets, building materials, the environment (including adjacent land), and to surface and ground water. The amount of exploratory work and chemical testing undertaken has necessarily been restricted by the short timescale available, and the locations of exploratory holes have been restricted to areas unoccupied by the building(s) on the site and by buried services.

New information, improved practices and legislation may necessitate an alteration to the report in whole, or in part, after its submission. Therefore with any change in circumstances or after the expiry of one year from the date of the report, the report should be referred to the Brownfield Consultancy Limited for re-assessment and, if necessary, re-appraisal.
