

Next Step Heating – Solar PV Quotation

On-Roof Solar PV Panel Systems

On Roof Mounting is likely to be one of the more cost effective options when retrofitting a solar PV system. Most standard solar PV panels are supplied with aluminium frames which are designed to be securely attached to prefabricated rails. These rails are then used to secure the whole solar assembly to the roof.

In Roof Solar PV Panel Mounting

In-Roof Mounting systems offer a flush finish where aesthetics are important. There is a large choice of systems that can be used to integrate with most types of roof. In-roof mounting can be cost effective when needing to re-roof and for new builds as slates, tiles etc won't be needed in the spaces covered by the solarpanels.

Flat Roof Solar PV Panel Mounting Systems

Flat Roof mounting systems can offer a low cost, quick to install and flexible option for mounting solar panels onto flat residential and commercial roofspaces. Tilt angles can often be optimised to make the most from the available space.
