| Description | Flight 3 Initial attempt at sub tertian culvert inspection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                         |                                                                                      |
| Notes       | <p>Upon assessment, we observed that the water level had risen above the recommended 300mm threshold, resulting in a reduced clearance of only 750mm between the water surface and the culvert ceiling. Initially, I was concerned that this limited vertical space would be insufficient, particularly due to the potential for splashback caused by downdraft turbulence from the drone's propulsion system.</p> <p>To reassess the viability of safe operation under these conditions, I elected to withdraw the drone from the culvert temporarily to allow for further evaluation and risk mitigation planning.</p> |                                         |                                                                                      |

## Flight #4

| Description | Flight 4 Primary culvert inspection post risk mitigation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                        |                                                                                     |
| Notes       | <p>Following further analysis, I determined that if we could successfully navigate through the initial splash zone and reach the area where debris had accumulated, there was a possibility of carefully progressing towards the target inspection point approximately 30 metres into the culvert.</p> <p>We managed to traverse beyond the primary splash zone; however, some water droplets had stained the camera lens, resulting in a reduction in visual clarity of the data capture.</p> <p>We proceeded cautiously, maintaining a controlled flight profile toward the desired position. Given the elevated water level and the inherently slow manoeuvring speed required under these constraints, it was critical to closely monitor battery capacity to ensure sufficient power remained for a safe return to the designated take-off and landing zone.</p> |                                        |                                                                                     |
